## FDIC NATIONAL EDITION

DIVISION OF  
INSURANCE

## In Focus This Quarter

◆ **High Loan-to-Value Lending: A New Frontier in Home Equity Lending**—High loan-to-value home equity loans have grown in popularity as consumers have sought ways to consolidate credit card debt and lenders have sought ways to deal with declining profit margins on traditional home equity loans. High loan-to-value loans pose unique risks for lenders because of their hybrid nature: they combine characteristics of both a secured home equity loan and an unsecured consumer loan. Losses on such loans are increasing rapidly, and the current rate of loss raises concern about how these loans might perform in an economic recession. *See page 4.*

*By Diane Ellis*

◆ **Commercial Development Still Hot in Many Major Markets, but Slower Growth May Be Ahead**—Following the experience of the 1980s, the threat of an over-supply of commercial real estate is watched with keen interest by market participants and observers alike. This article highlights nine metropolitan areas that may be vulnerable to overbuilding based on the rapid pace of development occurring within those markets, various indicators of current and prospective demand, and projections by credible industry analysts. These concerns could be mitigated to the extent that reduced credit availability within the capital markets leads to a slowing in construction activity. *See page 11.*

*By Steven Burton*

◆ **Recent Trends in Syndicated Lending**—A strong U.S. economy, intensifying lender competition, and increasing marketability of bank loans have driven record volumes of syndicated lending in the 1990s. These factors led to several years of liberalized underwriting in the syndicated market. While evidence suggests that some banks have tightened standards and terms for loans to large commercial borrowers, market developments and underwriting trends over the past several years have implications for credit quality, earnings, and liquidity at institutions that hold or originate syndicated loans. *See page 19.*

*By Steven E. Cunningham, Ronald L. Spieker*

## Regional Perspectives

- ◆ **Atlanta**—Several of the Region's real estate markets rank among the nation's most active in new construction, with community bank exposure growing in the Atlanta market. *See page 25.*
- ◆ **Boston**—Asset-quality indicators remain generally favorable, but delinquencies and charge-offs are increasing in credit card and consumer portfolios. *See page 26.*
- ◆ **Chicago**—Over one-third of the Region's community institutions experienced rapid growth in commercial real estate and construction loans. *See page 27.*
- ◆ **Dallas**—After several years of declining office vacancy rates, large amounts of newly constructed office space are coming onto the Dallas metropolitan market, making the Dallas market vulnerable to overbuilding. *See page 28.*
- ◆ **Kansas City**—The outlook for the Region's farm economy appears unfavorable, as low commodity prices and declining farm income are expected to continue. *See page 29.*
- ◆ **Memphis**—Commercial real estate markets remain active, with Nashville reporting high levels of construction starts despite signs of softening demand for office space. *See page 30.*
- ◆ **New York**—Regional commercial real estate markets remain generally subdued, with some markets reporting increased office construction activity and rising demand. *See page 31.*
- ◆ **San Francisco**—Active commercial real estate development in several of the Region's markets raises concerns about potential overbuilding, while community bank exposure in some of these markets has grown significantly. *See page 32.*

The *Regional Outlook* is published quarterly by the Division of Insurance of the Federal Deposit Insurance Corporation for the following eight geographic regions:

**Atlanta Region** (AL, FL, GA, NC, SC, VA, WV)

**Boston Region** (CT, MA, ME, NH, RI, VT)

**Chicago Region** (IL, IN, MI, OH, WI)

**Dallas Region** (CO, NM, OK, TX)

**Kansas City Region** (IA, KS, MN, MO, ND, NE, SD)

**Memphis Region** (AR, KY, LA, MS, TN)

**New York Region** (DC, DE, MD, NJ, NY, PA, PR, VI)

**San Francisco Region** (AK, AZ, CA, FJ, FM, GU, HI, ID, MT, NV, OR, UT, WA, WY)

Single copy subscriptions of the *Regional Outlook* can be obtained by sending the subscription form found on the back cover to the FDIC Public Information Center. Contact the Public Information Center for current pricing on bulk orders.

The *Regional Outlook* is available on-line by visiting the FDIC's website at [www.fdic.gov/publish/regout](http://www.fdic.gov/publish/regout). For more information or to provide comments or suggestions about the National Edition of *Regional Outlook*, please call Lynn Nejezchleb at (202) 898-3898 or send an e-mail to [lnejezchleb@fdic.gov](mailto:lnejezchleb@fdic.gov).

## *From the Editor*

---

To the Reader:

I am pleased to announce the first publication of the *Regional Outlook National Edition*. Since its inception, the *Regional Outlook* has been published quarterly in eight separate volumes that were tailored specifically for each FDIC Region. This format was ideal for the reader who wanted detailed analysis of a specific Region.

Beginning this quarter, the FDIC will publish in a single volume the highlights of our Regional analysis of trends affecting FDIC-insured institutions across the United States. The eight unabridged Regional editions will continue to be published for readers who want more detailed information about trends in their Regions. All editions will continue to offer the In Focus series of articles on trends affecting the risk exposures of FDIC-insured institutions.

For example, this quarter the In Focus series highlights important trends affecting commercial lenders and consumer lenders. The Regional Perspectives articles explore in more detail how these and other trends may affect FDIC-insured institutions around the United States.

Both the Regional and National editions are available by subscription or on the FDIC's website at [www.fdic.gov](http://www.fdic.gov). As always, we welcome your comments on the content or format of this publication. Please refer to the back cover and inside the front cover for information about how to subscribe or comment.

Sincerely,

George French  
Executive Editor

## *High Loan-to-Value Lending: A New Frontier in Home Equity Lending*

- **High loan-to-value (HLTV) loans are typically junior liens on owner-occupied single-family residences, but there is limited collateral protection because the combined loan amounts often exceed the value of the home.**
- **Nonbank, specialty lenders have dominated this line of business, and their growth has been fueled by strong demand for asset-backed securities collateralized by HLTV loans.**
- **Insured depository institution involvement in HLTV lending has been increasing, and opportunities for further involvement opened up when market turmoil resulted in a contraction of HLTV specialists.**
- **HLTV lending involves unique risks because it combines characteristics of both secured home equity lending and unsecured consumer lending.**

Just a few years ago, it would have been difficult to imagine a mainstream lender writing a home equity loan in excess of the equity that the consumer had in his or her home. However, intense competition and declining profit margins in traditional home equity lending have lenders looking to boost volume and profits by relaxing underwriting standards. At the same time, consumers are signaling their desire to transfer their credit card balances to lower-costing home equity loans. These trends have given lenders, including insured depository institutions, the impetus to enter the HLTV home equity market. Furthermore, new opportunities have opened up for insured depository institutions to get involved in HLTV lending as a result of turmoil in the equity and asset-backed securities market, which resulted in a severe liquidity crisis that effectively sidelined many HLTV specialists.

### ***HLTV Lending Taps Consumers' Desire to Shift Credit Card Debt into Home Equity Loans***

For the better part of the 1990s, credit card lending was dubbed the Wild West of consumer credit. This title was earned, in part, by lenders' aggressive marketing and solicitation of their cards and consumers' willing-

ness to push their holdings of credit card debt to record high levels. After several years of double-digit growth in credit card outstandings, the growth has slowed. However, this slowdown does not necessarily mean that the Wild West has been tamed. In fact, home equity lenders are blazing new frontiers in consumer credit. Chart 1 shows that the originations of home equity loans for asset-backed securitizations have surpassed the originations of credit card loans over the past two years.

It could be said that the home equity industry owes its resurgence to the boom in credit card lending that preceded it, because today's home equity borrowers primarily use these loans to consolidate their outstanding debt. A survey by the *Consumer Bankers Association* found that, whereas in 1991 home improvement was the primary reason for taking out a home equity loan, debt consolidation is now the primary reason, with 40 percent of borrowers using a home equity loan for this purpose in 1997. This shift also is evidenced by another recent survey by *Brittain Associates, Inc.*, which estimated that during a 24-month period ending June 1998, 4.2 million households converted \$26 billion in credit card debt to home equity mortgage debt. Given the high levels of credit card debt on households' balance sheets, it should be no surprise that consumers with other borrowing options are looking for ways to consolidate their debt and reduce their borrowing costs.

**CHART 1**

### ***HLTV Loans Are Hybrid Loans***

HLTV loans are considered hybrid loans and can be thought of as a marriage between secured lending and unsecured credit card loans. HLTV loans are typically junior liens on owner-occupied single-family residences where the combined loan amounts exceed the value of the home—sometimes by as much as 125 to 150 percent. Some lenders also make HLTV first mortgages, which enable consumers to finance their down payment and closing costs and consolidate other debts.

In return for pledging their home as collateral, borrowers are charged lower rates of interest than on unsecured consumer loans. Even at 125 to 150 percent loan-to-value, the rates on HLTV loans generally are lower than credit card loans. In 1997, the average rate on an HLTV was 13 to 14 percent, whereas the average rate on a credit card loan was 16 percent. Because HLTV loans carry lower interest rates and are long-term loans (15 to 30 years), the monthly payment on one is often considerably less than the total monthly payments on the loans that were paid off in the consolidation.

HLTV loans also appeal to consumers because they can benefit from the tax deductibility on a portion of their interest payments. Current IRS rules allow interest to be deducted on that portion of the loan that is equal to

or less than the value of the home at the time the loan is closed.

The primary disadvantage of converting unsecured credit card and other consumer debt to an HLTV loan is that in the event of default, the borrower could lose his or her home. However, many consumers burdened by the high cost of unsecured consumer debt apparently have viewed the chance to lower their monthly payments as worth the risk. HLTV loans have been particularly popular in California, where property value declines in the early 1990s left homeowners with little or no equity in their homes. The inset box shows the typical characteristics of an HLTV loan and an HLTV borrower.

### ***Underwriting of HLTV Loans Emphasizes the Borrower's Credit Quality***

Because of their limited or nonexistent collateral protection, HLTV loans typically are considered unsecured loans and the emphasis in underwriting is on the borrower's credit quality rather than on collateral value. Large HLTV lenders use credit scoring to underwrite their loans, and a major component of their scoring is a credit bureau or Fair, Isaac Company (FICO) score. Other important factors are the borrower's debt-to-income ratio, mortgage credit history, consumer credit history, bankruptcies, foreclosures, notice of defaults, deeds in lieu of foreclosure, and repossessions.

HLTV loans are not necessarily subprime loans; the term "subprime" refers to the credit quality of the borrower rather than the margin of collateral protection. Instead, many lenders assert that HLTV loans are made to "prime" borrowers and can point to the fact that FICO scores on HLTV loans have been rising, averaging approximately 689 in 1998. Scores above 680 are generally associated with "A" credit quality; however, the average ignores the fact that major HLTV lenders allow FICO scores to go much lower, typically as low as 620.<sup>1</sup> *Standard & Poor's* recently reported that performance problems clearly exist on loans for which the borrower's FICO score is below 650.<sup>2</sup>

#### ***Typical HLTV Borrower Characteristics***

Annual Income	\$60,000
Job Tenure	5 years
Age	Late thirties
FICO Score	680
Outstanding Nonmortgage Debt	\$20,000
First Mortgage Amount	\$110,000
Property Value	\$130,000

#### ***Typical HLTV Loan Characteristics***

Amount	\$30,000
Contract Interest Rate	13 to 14%
Term	25 years
Loan to Value	110%

Notes: HLTV = high loan-to-value; FICO = Fair, Isaac Company  
Source: General Accounting Office, based on interviews with public and private officials

HLTV UNDERWRITING GUIDELINES					
QUALIFYING PARAMETERS	A+	A	B+	B	C+
FICO SCORE	700+	680-699	660-679	640-659	629-639
MORTGAGE HISTORY (PAST 12 MONTHS)	1x30*	1x30	1x30	1x30	1x30
BANKRUPTCY (YEARS SINCE DISCHARGE)	3	3	3	5	5
MAXIMUM DEBT TO INCOME (%)	50	50	45	45	40
MAXIMUM LOAN TO VALUE	125	125	125	125	125
MAXIMUM CASHOUT	\$35,000	\$25,000	\$15,000	\$5,000	\$1,000
MAXIMUM LOAN AMOUNT	\$100,000	\$75,000	\$65,000	\$45,000	\$30,000

\* NUMBER OF TIMES DELINQUENT MULTIPLIED BY DAYS DELINQUENT.  
 NOTE: HLTV = HIGH LOAN-TO-VALUE; FICO = FAIR, ISAAC COMPANY.  
 SOURCE: THE 10K FILING OF A MAJOR HLTV LENDER.

The agencies that rate asset-backed securities collateralized by HLTV loans offer another perspective on the credit quality of HLTV borrowers. *Moody's* has described HLTV borrowers as in the "A-" to "B" grades, and Standard & Poor's has characterized the loans as "A-" to "B+" in terms of credit quality. Any grade below A can be considered subprime. Indeed, according to *Mortgage Information Corp.*, the bulk of subprime mortgage activity occurs in the A- category. However, some analysts have preferred to characterize HLTV borrowers as squarely in between the subprime and prime designations.

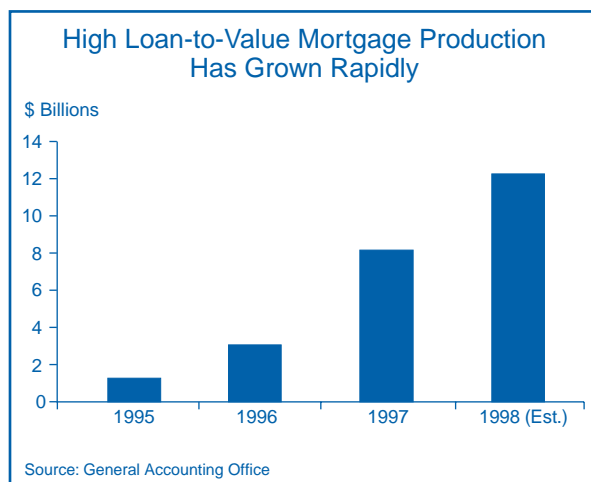

Whatever the label given to the quality of borrowers, they typically have a large amount of high-cost revolving debt, and converting this debt into a second lien on their home is an attractive alternative. They also might have some degree of poor credit performance. Table 1 shows the underwriting criteria used by one of the largest HLTV lenders. Because underwriting classification systems are not uniformly applied among HLTV lenders, this table should be viewed only as a guide.

***Fueled by Easy Access to Capital, HLTV Loans Have Grown Rapidly***

On the basis of the volume of loans securitized, the HLTV loan market has expanded rapidly over the past several years (see Chart 2). Originations have grown from \$1 billion in 1995 to \$8 billion in 1997 and are expected to be around \$12 billion in 1998.

Nonbank, specialty finance companies presently dominate the HLTV market, and their easy access to capital

CHART 2

has been an important factor behind their growth. These specialists depend on their ability to securitize the loans and sell them in the asset-backed securities market. Strong investor demand for all kinds of asset-backed securities has allowed HLTV lenders to raise a substantial amount of funding without a strong degree of corporate credit quality. However, their reliance on the asset-backed securities market to fund operations exposes them to *liquidity risk* if demand for these securities declines.

A healthy initial public offering market also has fueled the growth of these specialty lenders, and gain-on-sale accounting has allowed lenders to establish an earnings track record and attract debt and equity investors. Gain-on-sale accounting requires securitizers to calculate and record a gain on sale from securitizations; however, the use of gain-on-sale accounting exposes lenders to *pre-payment risk*. If the securitized loans prepay at a faster

rate than the assumption used to calculate the gain, the company could be forced to take a write-down, which can affect earnings, liquidity, and capitalization. Institutions that invest in securities collateralized by HLTV loans also are exposed to prepayment risk. (For more information on gain-on-sale accounting, see “Gain-on-Sale Accounting Can Result in Unstable Capital Ratios and Volatile Earnings” in *Regional Outlook*, second quarter 1998.)

In addition to the easy access to capital, favorable economic conditions also have encouraged HLTV lending. The long economic expansion has brought about the return of home price appreciation to nearly all parts of the country, which has encouraged HLTV lending because rising home values serve to reduce lender and investor exposure fairly quickly. The median sales price of existing single-family residences has increased an average of 4.39 percent per year since 1995, according to the *National Association of Realtors*.

### ***Market Turmoil Hit HLTV Specialty Lenders Hard***

The market volatility that began last summer illustrated the importance of *liquidity risk* and *prepayment risk*. HLTV specialists were faced with a liquidity crunch when they were hit hard in the equity downturn, in many cases significantly harder than the general market. Investors retreated from HLTV lenders and their asset-backed securities, in part as a result of a “flight to quality” as the Asian crisis spilled over into other global markets. A core of investors participating in the HLTV market also exited the market when prepayments occurred at faster rates than anticipated, largely a result of lower market interest rates, and forced lenders to take write-downs of interest-only residuals. Another factor in the investor retreat from this market was the growing skepticism concerning the performance of HLTV loans during an economic downturn.

When investor demand for asset-backed securities dried up, HLTV lenders were unable to securitize their loans profitably. This situation created a severe liquidity crisis for specialty lenders who relied heavily upon this source of funding. As a result, some lenders were forced to put themselves up for sale, and others were forced to undergo massive restructuring.

### ***HLTV Lending Presents Unique Risks to Home Equity Lenders***

In addition to the risks associated with the securitization of HLTV loans (liquidity and prepayment risk), HLTV lending poses some unique risks for lenders who hold these loans in their portfolio, service them, or guaranty the performance of asset-backed securities. Because HLTV loans are a relatively new product, their *credit risk* is untested and could be affected by the following factors:

- **Increased rate of default.** Data on the performance of HLTV loans are limited; however, the loss potential is starting to become visible when vintage analysis is performed. Chart 3, next page, shows that when recent vintages are adjusted for seasoning, charge-off rates on HLTV loans are increasing at a rapid rate. Both the severity and frequency of default are much higher than for traditional A-quality home equity loans and are even higher than subprime home equity loans. The fact that charge-offs are higher than subprime loans suggests that the credit quality of HLTV borrowers is not too different from subprime borrowers and that when default occurs, the loss is more severe because of the lack of collateral protection. Lenders who do not accurately forecast the magnitude and costs of default associated with HLTV loans, or who make underwriting mistakes, might find that this line of business is not as profitable as anticipated.

Lenders that rapidly increase HLTV exposures might consider the use of vintage analysis, also called “static pool” analysis, as a means of evaluating loan portfolio performance. This technique is effective when there is rapid growth, which can make it more difficult to accurately track delinquency and default trends when only an average delinquency or default ratio is calculated. Refer to “Subprime Lending: A Time for Caution” in *Regional Outlook*, third quarter 1997, for additional discussion on vintage analysis.

- **Untested performance in a recession.** HLTV lending has existed for only a few years and has yet to be tested by economic recession. The rapid rise in charge-offs on HLTV loans has occurred in a relatively robust economic environment, and the losses during an economic downturn could be considerably

higher than anticipated. Moody's has asserted that losses will mimic those of credit cards, and losses on credit card loans are usually higher than other consumer mortgage-related products.

HLTV lenders' heavy reliance on credit-scoring models raises further questions about how these loans might perform in a recession because these models are largely unproven in a recession as well. To improve the accuracy of credit-scoring models and the model's ability to appropriately price the risk assumed, lenders can continually test and refine credit-scoring models to ensure that actual performance approximates projections.

Changes in the borrower's financial condition present a greater risk to HLTV lenders than in other types of secured lending, which introduces additional *credit risks*. In the event of default, the lender is likely to suffer a complete loss because foreclosure is probably infeasible and the size of HLTV loans is much larger than other types of unsecured or partially secured loans. Therefore, adverse changes in the borrower's financial condition are very important and can be affected by the following factors:

- **Debt reloading.** The primary reason consumers take out an HLTV loan is to consolidate credit card and other high-cost consumer debt. However, lenders cannot prevent HLTV borrowers from running up additional credit card debt after the loan is made. Consequently, these loans might serve to only postpone or amplify credit problems. A recent survey by

Brittain Associates, Inc., indicates that a large percentage of borrowers who take out home equity loans proceed to run up credit card debt shortly thereafter. Their survey of over 6,000 borrowers who used home equity loans to consolidate their debts revealed that only 30 percent of those borrowers remained free of credit card debt one year later.

- **Long-term exposure.** Consumer loans typically have been made on a short-term basis; however, HLTV loans are made for terms up to 30 years. Therefore, the credit quality on an HLTV loan is more vulnerable to catastrophic events such as borrower job loss, illness, or divorce. Furthermore, the term of these loans far exceeds the predictive power of FICO scores, which have proven to be predictive for about a two-year period according to Moody's.

Because of their fixed terms and limited collateral protection, there are some unique *operational risks* associated with servicing and collecting an HLTV loan. Servicing and collecting an HLTV loan differs somewhat from servicing and collecting both secured lending and credit card lending because of the following factors:

- **Limited default remedies.** The servicing and collecting of HLTV loans are complicated by the fact that the threat of foreclosure is not as severe as in traditional secured lending. According to Moody's, HLTV lenders must adopt a collection strategy similar to credit card lenders that will require early intervention and the ability to "talk" the borrower into

**CHART 3**

**CHART 4**

making a payment without resorting to foreclosure. However, unlike credit card lenders, HLTV lenders have less flexibility in collection because lines cannot be adjusted and interest rates cannot be raised. The different demands for servicing and collecting these loans, compared with traditional and subprime home equity loans, could strain institutions that do not have an adequate investment or expertise in collecting these loans.

According to Moody's, HLTV lenders generally write off their loans as a loss once they become 180 days delinquent. In contrast, subprime lenders go through a lengthy foreclosure procedure. The speedier resolution of HLTV loans is reflected in a lower level of delinquencies in HLTV portfolios compared with subprime portfolios (see Chart 4, previous page).

- **Limited borrower flexibility and motivation.** After a borrower has taken out an HLTV loan, opportunities to refinance are limited, and selling the home often is not feasible because of the large amount of cash needed at closing. As a result, counseling borrowers might prove to be harder than in credit card lending. Also, with negative equity in their homes, borrowers might have less incentive and ability to work with the lender to bring the loan current than to allow foreclosure.

### ***Insured Depository Institution Involvement in HLTV Lending Is Increasing***

Insured depository institution involvement in HLTV lending reportedly has been growing. Their precise involvement is difficult to quantify because these loans are not delineated in bank or thrift Call Reports. However, one indication of their growing involvement is cited in the Consumer Bankers Association 1998 home equity loan study. Twenty-five percent of respondents to its survey offered home equity loans with loan-to-values in excess of 100 percent, up from only 5.8 percent one year earlier.

Banks and thrifts can become involved in HLTV lending by using a variety of strategies. They can lend directly to HLTV borrowers or purchase HLTV loans from loan brokers and hold them in portfolio. Institutions also can originate the loans and securitize them or sell them to another company that will securitize them.

A more indirect way for insured depository institutions to get involved in this market is to lend to HLTV specialty lenders in the form of warehouse lines. Institutions also can service HLTV loans or invest in asset-backed securities secured by HLTV loans.

In light of the contraction of HLTV specialists, the question arises as to whether banks will view this as an opportunity to further expand their presence in HLTV lending, given that consumer demand for these products is still strong. Recent press reports indicate that this is happening, as some insured depository institutions recently have piloted HLTV lending programs by buying loans and keeping them in portfolio.<sup>3</sup> Another way that banks have recently become involved in HLTV lending is by investing in HLTV specialists. Many HLTV specialists have been looking for opportunities to affiliate with firms that have plentiful and stable sources of liquidity ("deep pockets"), and insured depository institutions have been viewed as ideal candidates. Several of the largest HLTV specialists have an insured depository institution as an affiliate.

### ***Insured Depository Institutions Are Subject to Real Estate Lending Standards***

Unlike many of the specialty finance companies, insured depository institutions are subject to regulations prescribed by the federal supervisory agencies. In 1992, the federal banking and thrift supervisory agencies finalized a uniform regulation and interagency guidelines for real estate. The regulation, in part, requires institutions to adopt and maintain written policies that establish appropriate limits and standards for all real estate loans, including HLTV loans. When a bank adopts a policy, the regulation requires consideration of the Interagency Guidelines for Real Estate Lending Policies. These guidelines state that institutions should establish their own internal loan-to-value limits for real estate loans; however, they also indicate that the internal limits should not exceed 90 percent on a home equity loan.<sup>4</sup> The guidelines recognize that it might be appro-

---

<sup>3</sup> Timmons, H. "Banks Poised to Move in as High-LTV Lenders Fall." *American Banker*, October 28, 1998.

<sup>4</sup> The guidelines state, "A loan-to-value limit has not been established for permanent mortgage or home equity loans on owner-occupied, 1- to 4-family residential property. However, for any such loan with a loan-to-value ratio that equals or exceeds 90 percent at origination, an institution should require appropriate credit enhancement in the form of either mortgage insurance or readily marketable collateral."

priate to deviate from these guidelines and state that loans made in exception to these guidelines should be identified in the institution's records and reported to the board of directors at least quarterly. Furthermore, the guidelines state that the aggregate amount of all loans in excess of the supervisory loan-to-value limits should not exceed 100 percent of total capital.

### ***Competition from HLTV Loans Is Driving a Loosening in Underwriting on Other Home Equity Loans***

Even for insured depository institutions not directly involved in the HLTV market, the competition posed by this product already is evident in the underwriting of other types of home equity products. The Office of the Comptroller of the Currency reported in its latest survey of the 77 largest national banks in the country that underwriting on home equity loans has been loosening for three years, a time period that corresponds with the life of the HLTV market. They reported that in 1998, the percentage of banks tightening standards on credit card loans is nearly matched by the percentage of banks loosening their underwriting standards on home equity loans. Competition was cited as the primary reason for loosening home equity standards, and

an easing of collateral requirements was the primary method.

### ***Conclusion***

HLTV lending has provided a new option for consumers to work their way out from under burdensome credit card debt. It also has provided lenders with a new and potentially profitable line of business. Insured depository institution involvement in this line of business is growing and could continue to grow, especially if liquidity problems that have affected HLTV specialists continue. As with any line of business, success is dependent upon understanding the particular nature of the HLTV business and making the appropriate commitment of resources and expertise. With HLTV lending, there are unique risks involved because of the compound nature of these loans, which contain characteristics of both a secured home equity loan and an unsecured consumer loan. The risks involved in HLTV lending are further heightened by the fact that the performance of these loans is largely untested in an adverse economic environment.

*Diane Ellis, Senior Financial Analyst*

## ***Commercial Development Still Hot in Many Major Markets, but Slower Growth May Be Ahead<sup>1</sup>***

- **Oversupply within commercial real estate markets typically arises from the difficulty developers face in accurately predicting future demand for a given project, particularly when projections are based on temporary or unsustainable increases in demand. Easy access to investment capital in the form of lower borrowing rates or relaxed underwriting standards can exacerbate the overproduction of space.**
- **This analysis identifies nine major metropolitan markets believed to be vulnerable to broad-based overbuilding.<sup>2</sup> This vulnerability stems from rapid ongoing development across multiple property types, which threatens to outpace absorption or demand levels over the next one to two years. Overbuilding concerns are heightened by cyclical and secular demographic and economic trends that portend lower demand for commercial space.**
- **Trends in the capital markets may have tempered the appetite for further development in some rapidly expanding metro areas. Should such trends continue, construction activity could moderate, thereby mitigating some of the overbuilding concerns expressed in this article.**

Since the boom development years of the 1980s, and the bust that followed, the financial community has devoted considerable resources to analyzing commercial real estate trends. The primary purpose of these efforts is to detect, as early as possible, warning signs of potential imbalances between supply and demand. The markets highlighted in this article are considered vulnerable to possible overbuilding on the basis of various early warning signs. Each of these markets is experiencing rapid commercial real estate development across multi-

ple property types. In addition, each market exhibits one or more of the following characteristics: high vacancy rates relative to the pace of development, declining employment growth trends, declining in-migration trends, projected increases in vacancy rates by credible industry experts, and significant dependence on industry sectors vulnerable to either weak Asian markets or a slowing domestic economy.

The term “vulnerable” is used here to signify a potential, as opposed to a certain, outcome. In previous cyclical downturns, falling commercial real estate values were preceded by economic events that resulted in lower demand: Declining energy prices preceded the mid-1980s decline in Southwestern real estate markets; weaknesses in the financial sector preceded the late 1980s decline in Northwestern real estate markets; and sharp defense cutbacks preceded the early 1990s decline in Southern California real estate markets. It remains to be seen whether weakening Asian markets or prospects for slower economic growth serve as catalysts for slower commercial real estate demand in the current cycle. Whatever the catalyst, markets most affected by a downturn in real estate values will be those in which optimistic expectations, the basis for current construction activity, fall farthest from the mark.

### ***Why Do Markets Become Overbuilt?***

Commercial property developers often face substantial lags between a project’s conception and its completion: The longer the construction period, the greater the uncertainty surrounding demand projections. These risks can be largely mitigated if the developer enters into presale contracts or preleasing agreements with financially sound parties prior to breaking ground on construction. However, it is not unusual in rapidly developing and highly competitive markets for developers to anticipate or “speculate” what demand levels will be, based on current trends. If the market in question is experiencing a period of temporary or unsustainable growth (a “boom” period, for example), then projections may lead to an overly optimistic outlook for future demand, particularly when forecasts are weighted heavily toward recent rental, sales, and demographic trends. Projection error also arises from

---

<sup>1</sup> In fall 1998, the FDIC’s Division of Insurance published a report ranking the risk of overbuilding within major metropolitan markets (see “Ranking the Risk of Overbuilding in Commercial Real Estate Markets,” *Bank Trends*, October 1998). This paper, which was based mainly on market information as of year-end 1997, highlighted six major metropolitan areas where the rapid pace of current construction activities raised concerns over the potential for broad-based overbuilding.

<sup>2</sup> “Broad-based overbuilding” signifies potential overbuilding in two or more of five property types: office, industrial, retail, apartment, and hotel.

the failure to consider competitors' planned development activities.

If a developer's demand projections fail to materialize, the result is an overhang of commercial property beyond what the market can absorb during a reasonable time frame. Easy access to investment capital can exacerbate overproduction of space by reducing or eliminating incentives to make reasoned and prudent investment decisions. Excessive leverage, where the developer has little personal capital at risk on a particular project, is a familiar example often associated with the excessive development of the 1980s. Loan pricing that fails to adequately account for the risks involved in a construction project is another example of how financing incentives could lead to imprudent development decisions.

### Ranking the Risks of Overbuilding

The October 1998 *Bank Trends* (see footnote 1) study employed a three-step process to rank the vulnerability of markets to possible overbuilding. First, major metropolitan markets were ranked in terms of current construction activity<sup>3</sup> relative to existing space for each of five property types: office, industrial, retail, apartment, and hotel. Second, relative construction activity was compared with current vacancy rates to assess the competitive pressures faced by newly developed projects. Third, market-related research was reviewed to determine which markets analysts considered candidates for possible supply/demand imbalances. Although the same approach was used in this updated analysis, additional factors were considered, including employment and population growth trends, the dependence of rapidly developing metropolitan areas on specific employers or industries, and the relationship between current economic trends and the potential demand for commercial real estate space.

<sup>3</sup> Construction activity generally refers to recent completions plus projects in process of being built. In the case of office and industrial properties, the source of data is *CB Commercial/Torto Wheaton Research*, and construction activity refers to completions for the last four quarters plus projects under construction. For all other property types, the source is *F.W. Dodge* and *ERE Yarmouth*, and construction activity refers to completions, projects in process of being built, starts, and pending projects.

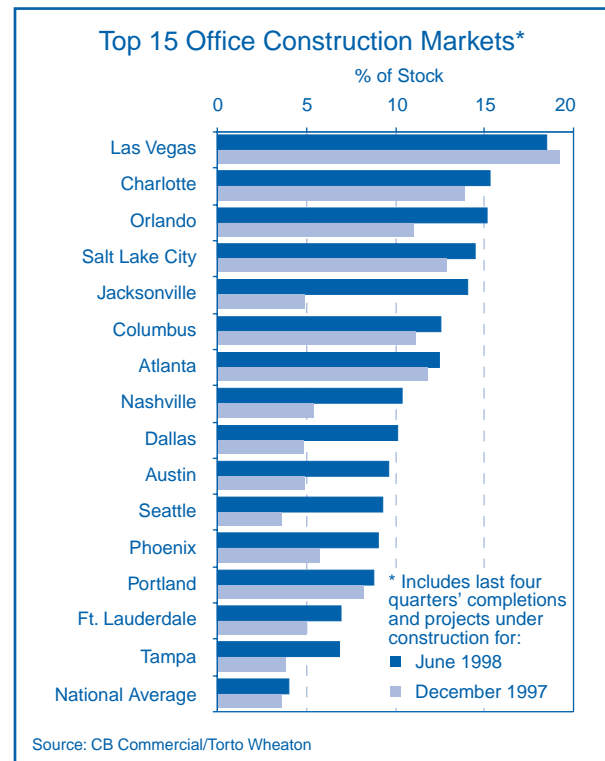

### Most Active Construction Markets

Charts 1 through 5 show the level of construction activity, for each property type, relative to the total stock of space as of June 30, 1998, for the top 15 major metropolitan markets. Although slowing somewhat, development in the Las Vegas market continues to lead all other markets in relative terms for office, industrial, and hotel construction. Las Vegas is also among the most active markets in apartment and retail construction. Other markets experiencing rapid development across multiple property types include Salt Lake City, Charlotte, Atlanta, Portland, Phoenix, Orlando, Dallas, Austin, Nashville, Jacksonville, and Seattle. As the charts show, office, industrial, apartment, and hotel construction activity rose from year-end 1997 levels among a majority of the fastest-developing markets. Retail development, however, appears to have slowed in a majority of the most active development markets during the first half of 1998.

### Comparing Construction Activity with Vacancy Rates

Newly completed speculative projects must compete with existing vacant space. Accordingly, it is worthwhile to compare measures of relative construction

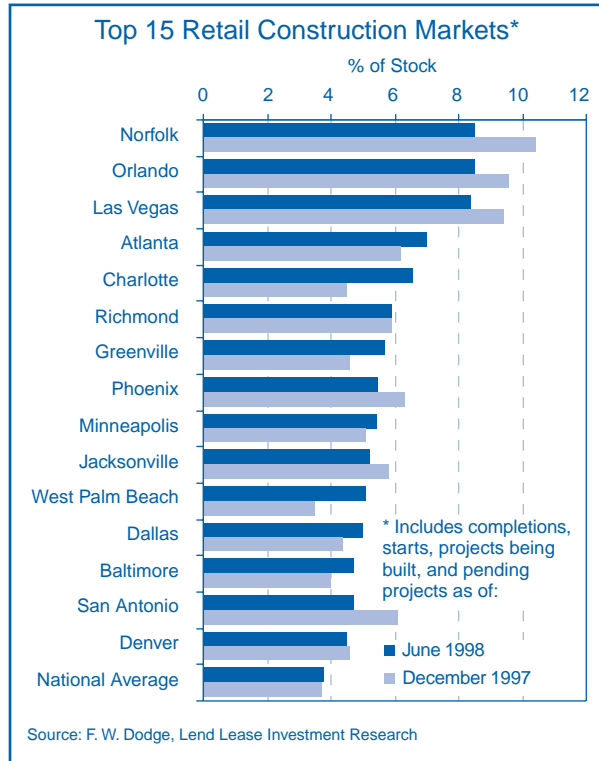

CHART 1

**CHART 2**

**CHART 3**

**CHART 4**

**CHART 5**

CHART 6

activity with current vacancy rates (as shown in Charts 6 and 7 for office and industrial space). The main idea behind these charts is that market segments with high existing vacancy rates raise the degree of competitive pressure for newly built space; markets with high vacancies may have less justification for continuing increases in new stock.

In the office sector, Las Vegas stands out as having the highest level of new development combined with high existing vacancy rates. Although the pace of development is markedly slower, office markets in both Atlanta and Dallas appear to be expanding rapidly despite high existing vacancy rates. In the industrial sector, Las Vegas, Atlanta, Riverside, Salt Lake City, and Phoenix all appear to be experiencing rapid development despite relatively high existing vacancy rates.

**Analyst Outlooks for Commercial Real Estate Advocate Caution**

The first six months of 1998 saw continuing strong market fundamentals in most major markets and most property types: *CB Commercial/Torto Wheaton Research (CBC)* reported continuing nationwide declines in office and industrial vacancy rates accompanied by increasing rental growth rates,<sup>4</sup> *Wheat First Union (Wheat)* reported improvements in occupancy and rental rates across the 30 major apartment markets it follows,<sup>5</sup> and *Smith Travel Research (Smith)* reported continuing improvements in average daily room rates

<sup>4</sup> CB Commercial/Torto Wheaton Research, *The Office Outlook, The Industrial Outlook, and The Retail Outlook*, Fall 1998.

<sup>5</sup> Wheat First Union, *Industry Report: Quarterly Apartment Review*, October 21, 1998.

CHART 7

despite a modest decline in occupancy rates for the lodging sector (through the first nine months of 1998).<sup>6</sup> The performance of the retail sector has been more mixed, as indicated by a significant decline in estimated rental growth rates from 1996 to 1997 (CBC) while retail vacancy rates have held steady over the past 12 months (*F.W. Dodge*).<sup>7</sup>

Despite these generally positive trends, market observers are becoming more cautious about the outlook for commercial real estate markets. Much of their concern stems from significant increases in projected supply in the face of moderating absorption rates. CBC, for example, projects that nationwide office vacancy rates will rise from 9.3 percent as of June 1998 to 12.1 percent by June 2000 as a result of a sharp increase in completions combined with moderating absorption. Markets with the highest and most significant increases in projected office vacancy rates are highlighted in a recent *Lehman Brothers* study, which identifies 17 office markets as “danger zones.”<sup>8</sup>

Analysts have also raised concerns over rapid development in other property types. F.W. Dodge, for instance, anticipates a sharp rise in the ratio of retail completions

<sup>6</sup> Smith Travel Research, *Smith Travel Research Announces 1998 September and Third Quarter U.S. Lodging Industry Reports*, [http://www.str-online.com/news/releasedir/1998/pr981104\\_3rdqtr.html](http://www.str-online.com/news/releasedir/1998/pr981104_3rdqtr.html).

<sup>8</sup> These markets are Salt Lake City, Columbus, Austin, Nashville, Charlotte, Orlando, Las Vegas, Baltimore, Atlanta, Dallas, Phoenix, Philadelphia, Indianapolis, Chicago, Sacramento, Miami, and Houston (Lehman Brothers, *Commercial REIT Research: Eye on Office Markets*, October 1998).

to absorptions over the coming two years. In addition, the pace of hotel development has picked up substantially over the past two years to levels not seen since the late 1980s (see Chart 8). According to Smith, hotel completions continue to outpace demand and are expected to result in lower occupancy levels in 1999. For the apartment sector, Wheat cautions against a continuing escalation in apartment permits despite some expected slowing in employment growth in various markets over the coming 12 months.<sup>9</sup>

### Economic Conditions May Temper Commercial Real Estate Demand

The nation's economy has shown unprecedented resiliency, even as some indicators suggest that growth may moderate in the near term. For instance, weakened global markets have placed increasing pressures on exporters, who have seen a falloff in demand in the wake of weaker foreign currencies relative to the dollar. Domestic firms, too, face rising competition from cheaper imports. These factors have created negative near-term expectations for corporate profitability, which in turn have resulted in rising layoffs and slowing employment growth. Although most economists feel that prospects for a recession are remote in the near term, even a modest slowdown in economic growth could result in higher vacancy rates in markets experiencing rapid development.

Over the longer term, various economic and demographic trends imply a weaker outlook for commercial real estate demand relative to past real estate cycles. In a recent analysis of the commercial mortgage-backed securities (CMBS) market, *Moody's* identifies the following trends, each of which implies secular declines in demand for one or more property types<sup>10</sup>:

- more efficient office space utilization as measured by continuing declines in square feet per worker;
- more efficient inventory management as measured by a proportional increase in the ratio of inventory growth to growth in warehouse space;
- shifts in spending patterns by baby boomers, the largest age cohort, away from goods and toward services;

<sup>9</sup> Wheat specifically notes deteriorating supply/demand ratios in Dallas, Houston, Orlando, Charlotte, Nashville, and the San Francisco Bay area.

<sup>10</sup> Moody's Investor Service, *CMBS and the Real Estate Cycle: Less Margin for Error*, October 9, 1998.

CHART 8

- declining scrappage rates of obsolescent buildings because of a decline in the average age of the current stock of space relative to the comparable stage of prior cycles; and
- expected declines in labor force growth as the proportion of older workers increases.

In addition to these factors, other analysts have pointed out that tight labor markets and overtaxed infrastructure (e.g., water, roads, sewer, and public transportation) constrain demand by limiting growth within a particular market. Suburban areas that have seen the bulk of new construction over the past few years may be particularly hard hit if there is a backlash against the congestion and infrastructure capacity issues that accompany rapid growth.<sup>11</sup>

### Markets Most Vulnerable to Overbuilding

Based on a review of supply and demand trends coupled with analyst opinions and projections, the following markets appear to be most vulnerable to broad-based overbuilding in the coming one to two years (see also Table 1, next page, for prevailing trends in these markets). These markets are discussed in more detail in the Regional Perspectives section.

<sup>11</sup> See, for example, Price Waterhouse/Lend Lease Investment Research, *Emerging Trends in Real Estate 1999*.

**Las Vegas**

Las Vegas’s hotel, office, and industrial development far surpasses that of other major markets, with ratios of construction activity to current space of 37 percent, 19 percent, and 12 percent, respectively. Rapid development is occurring despite high and increasing office and industrial vacancy rates, which place additional competitive burdens on newly completed space. The area’s retail and apartment sectors are also developing rapidly, ranking third and fourth, respectively, among major markets. Although Las Vegas continues to enjoy one of the fastest employment growth rates in the country, the rate of job growth has slowed considerably from 1994 to 1996 levels. Its real estate markets are highly dependent on the gaming sector, which could be especially vulnerable to a nationwide slowdown in economic activity. The city would be particularly hard hit by a downturn in real estate prices, as fully 10 percent of its workforce is employed in the construction sector (twice the national rate).

**Atlanta**

Of the nation’s largest metropolitan markets, Atlanta ranks among the top ten in office, industrial, retail, and apartment construction, with ratios of construction activity to current space of 12 percent, 8 percent, 7 percent, and 5 percent, respectively. Development, much of which is widely reported to be speculative, is very active despite relatively high office and industrial vacancy rates. Atlanta’s expanding real estate markets have been driven largely by strong in-migration and

employment growth rates. However, both these rates are slowing, and many market observers are concerned that the area’s development cycle has reached its peak.<sup>12</sup>

**Nashville**

Nashville ranks among the top ten metro markets in office and apartment development, with ratios of construction activity to existing space of 10 percent and 6 percent, respectively. Although not among the top 15 markets, Nashville’s hotel sector is expanding rapidly as well (construction activity stands at 12 percent of current space). Nashville’s economy is reported to be slowing because of recent losses in manufacturing-sector jobs and slowing net-migration rates. The rapid pace of development has recently placed downward pressure on office, industrial, and hotel occupancy rates.

**Salt Lake City**

Salt Lake City ranks among the top five markets in the nation in office, industrial, and hotel development, with ratios of construction activity to current space of 14 percent, 6 percent, and 27 percent, respectively. The main drivers behind the area’s rapid development have been high-tech corporate expansions, population in-migration, and preparation for the 2002 Winter Olympic Games. However, both job growth and in-migration rates are slowing, which could result in lower absorption rates for commercial space in the near term. Over

<sup>12</sup> See the November 1998 issue of the Federal Reserve Board’s *Beige Book*.

the longer term, analysts have expressed concerns that development and job growth attributable to the Olympics will result in a significant glut of space following the Winter Games.

### **Charlotte**

Charlotte ranks among the top five metro areas in office, retail, and apartment development, with ratios of construction activity to current space of 15 percent, 7 percent, and 6 percent, respectively. The area's hotel sector is also developing rapidly. Charlotte's real estate markets are highly dependent on the health of the financial industry, which has been the primary driver of development activity. However, job growth in the financial services sector has recently slowed, and the manufacturing sector (which accounts for 19 percent of all jobs) is experiencing net job losses.

### **Portland**

Portland has the third most active hotel and apartment development in the nation, with ratios of construction activity to current space of 25 percent and 7 percent, respectively. The area's office market is also expanding rapidly. Portland's development has been driven largely by in-migration and job growth in the technology sector. However, because of the significance of exports to the overall economy (exports to Asia account for approximately 7 percent of Oregon's gross state product), the technology sector is particularly vulnerable to weak Asian markets. Accordingly, job growth has moderated, reaching its lowest level in five years. The area has also experienced a recent decline in construction-sector jobs. Although still strong, in-migration rates have fallen from 1996 levels.

### **Phoenix**

Phoenix ranks among the top ten metro markets in industrial, retail, hotel, and apartment development, with ratios of construction activity to existing space of 6 percent, 6 percent, 18 percent, and 6 percent, respectively. The area is also experiencing rapid development in the office sector. Phoenix has one of the fastest-growing job markets in the country. Although still strong relative to the nation, employment growth has

slowed somewhat since 1996, as has the rate of in-migration. The prominence of the semiconductor and high-tech businesses makes Phoenix especially vulnerable to the economic slowdown in Asia.

### **Dallas**

Dallas ranks among the top ten metro markets in office, hotel, and apartment development, with ratios of construction activity to existing space of 10 percent, 19 percent, and 6 percent, respectively. The area is also experiencing rapid development in the retail sector. Dallas's economy remains one of the fastest growing in the country, and in-migration to the area continues to rise. However, economic growth has slowed somewhat recently because of weakening high-tech and energy sectors. Although its industrial base is more diversified today than in the mid-1980s, Dallas remains exposed to a large energy sector, whose profits are vulnerable to declining oil and energy prices. Concerns over the volume of planned office development have led to widely published reports of curtailments in credit availability to speculative office projects. Although tighter credit availability may ease pressures on vacancy rates over the long term, the market will still have to absorb the large volume of space presently under construction, much of which is speculative.

### **Orlando**

Orlando ranks among the top three metro markets in office, retail, and apartment development, with ratios of construction activity to existing space of 15 percent, 9 percent, and 7 percent, respectively. Of the nine markets discussed in this article, Orlando's current pace of construction is perhaps easiest to support, thanks to rising employment and in-migration growth. However, despite strong employment growth, office vacancy rates have edged higher over the past 12 months because of the rapid pace of construction. Orlando may be more vulnerable than other metropolitan areas to a slowdown in the national economy owing to its dependence on the tourism sector.

### ***Credit Availability Affects the Pace of Commercial Development***

CMBS and real estate investment trusts (REITs) have generated a significant share of funding for commercial real estate over the past several years.<sup>13</sup> As a result, any disruption in CMBS and REIT markets strains credit availability for new commercial development. For instance, widening CMBS spreads in the wake of September's market volatility have caused many issuers to either delay or cancel new CMBS issues. REITs, too, have reportedly curtailed purchases because of falling per-share values and a corresponding decline in equity issues to support acquisitions.

Weaknesses in the CMBS and REIT markets also may be dampening many lenders' enthusiasm for commercial real estate development. Construction lenders will be less willing to make speculative loans to the extent that permanent funding is not available, and CMBS and REITs served as major providers of such funding. REITs were particularly aggressive purchasers in such markets as Atlanta, Orlando, and Dallas.<sup>14</sup> Tightened construction lending conditions appear to be borne out by the November 1998 issue of the *Federal Reserve Board's Beige Book*, which indicates that new construction for speculative commercial projects has either been curtailed or come to a virtual halt throughout many Federal Reserve districts, including Atlanta and Dallas. Most districts also reported tightened credit conditions and higher loan pricing, which could further dampen construction activity.

The turmoil faced by CMBS and REITs presents both opportunities and risks for banks. Many industry participants view tighter credit accessibility as a positive development in light of the rapid pace of construction,

which, in some cases, has been accompanied by extremely tight loan pricing margins and a loosening of underwriting standards. However, some lenders may view the changing fortunes of CMBS and REITs as an opportunity to regain market share. In any case, it will take several months for recent market events to be fully reflected in hard numbers for construction activity. Whether tightening credit availability proves to be a temporary phenomenon given the recent, albeit gradual, recovery in CMBS spreads and the broad recovery in the equity markets, remains to be seen.

### ***Summary***

This article updates a previously published analysis that used year-end 1997 data to rank the potential vulnerability of major metropolitan areas to overbuilding. Using primarily midyear 1998 information, this update adds three markets to the six identified in the initial analysis as vulnerable to broad-based overbuilding. This assessment is based on a number of factors including construction activity trends, local area employment and population migration trends, as well as a collection of views and projections from credible industry analysts. For many of these markets, the prospects for near-term declines in commercial real estate demand may be increasing because of slower economic growth and weakened markets abroad. Certain secular demographic and economic trends also suggest the possibility of lower demand levels in the current cycle relative to prior cycles. Although data through June 1998 indicate ongoing rapid development, there is growing evidence that recent events in the capital markets have at least temporarily tempered the appetite for further development in some rapidly expanding metro areas. For these markets, most participants view the curtailment in credit availability in a positive light because it would serve to moderate the severe cyclical swings in real estate values experienced by several markets during the 1980s.

## *Recent Trends in Syndicated Lending*

- **A strong U.S. economy, intensifying competition, and the increasing marketability of bank loans have driven record volumes of syndicated lending in the 1990s.**
- **After several years of liberalized underwriting, evidence suggests that some banks have tightened standards and terms for loans to large commercial borrowers.**
- **Market developments and underwriting trends over the past several years have implications for credit quality, earnings, and liquidity at institutions that hold or originate syndicated loans.**

Commercial and industrial lending is a major source of revenue for commercial banks, yet this business line has lagged other major lending categories in terms of liquidity, standardization, and commoditization. However, in recent years the transformation of commercial lending has accelerated and is altering the way lenders do business. This trend has been particularly apparent in syndicated commercial lending. This article briefly defines syndicated loans, reviews the 1990s boom in the market, and discusses the implications of competitive pressures and secondary market liquidity for underwriting trends and risk profiles of commercial banks active in this market.

### *Syndicated Lending Overview*

A syndicated loan is a credit extended to one large or medium-sized corporate borrower that is originated by a group, or syndicate, of lenders. Syndicated lending differs slightly from participation lending, which is common in commercial banks. Although both types of lending allow for flexibility in reducing company-specific risk and adhering to legal restrictions for loans to one borrower, only one lender originates a participation loan, which is then sold in undivided participation interests either concurrently or subsequently to third parties.<sup>1</sup> A syndicate usually consists of a group of institutions that work closely on a number of deals that are sold to subscribers at origination.

---

<sup>1</sup> American Bankers Association, *Banking Terminology*, 3rd ed., 1989, p. 345.

Syndicated loans can generally be categorized according to rating, terms, pricing, or target investors. The investment-grade loan market, often referred to as the pro-rata or retail market, is the lowest-risk segment of syndicated lending and comprises approximately 80 percent of all volume originated from 1987 to 1997. These loans commonly take the form of liquidity backstops or lines of credit and are marketed to commercial bank investors. *Loan Pricing Corporation (LPC)* defines these credits as those rated BBB-/Baa3 or better, or nonrated deals with pricing equal to or less than rated deals in these bands. Near-investment-grade, leveraged, and highly leveraged markets, often referred to as B, C, and D tranche term loans or non-investment-grade loans, include credits with longer maturities, greater risk, and higher pricing. Non-investment-grade loans are typically structured for institutional investors and compete more directly with the traditional high-yield bond market. LPC defines non-investment-grade loans as those rated BB+/Ba1 or worse, or nonrated deals with pricing greater than deals graded BBB-.<sup>2</sup>

### *Competitive Trends in the Syndicated Loan Market*

A handful of large U.S. commercial banking companies originate the vast majority of U.S. syndicated corporate credits across all quality types. According to LPC, 14 U.S. banking companies were among the top 25 syndicated lenders (based on the number of agent or co-agent transactions) and accounted for half of 1998 syndicated loan transactions to U.S. corporations through mid-November.<sup>3</sup> In 1997, nine U.S. banking companies were among the top 25 and executed 36 percent of the market's transactions. Before 1997, the most active domestic commercial banks saw their market share erode from a peak of 45 percent of transactions in 1992 to 34 percent in 1996, primarily because of intensifying competition from nontraditional syndicated lenders such as investment banks and foreign banks. Although U.S. banks have recently recovered market share (as Japanese banks have significantly withdrawn from the market), a strong U.S. economy, expanding liquidity in the bank loan market, and a trend toward one-stop shopping

---

<sup>2</sup> Loan Pricing Corporation, *Gold Sheets*, Third Quarter 1998 Review, p. 2.

<sup>3</sup> Loan Pricing Corporation, *Gold Sheets*, November 16, 1998, p. 6.

in the financial services industry have attracted competitors to the syndicated market in the 1990s.

### Syndicated Loan Liquidity

U.S. commercial banking companies retain or buy a large volume of syndicated loans, yet estimates show that most of the volume is sold to other institutional investors. Information from the shared national credit program<sup>4</sup> indicates that at year-end 1997, FDIC-insured commercial banking companies had extended facilities and commitments totaling \$1.8 trillion, of which an estimated \$565 billion was funded. To put this figure in perspective, an official of the *Office of the Comptroller of the Currency* estimated that 57 percent of outstanding syndicated loans were held by foreign banks; 26 percent by originating banks, mutual funds, and insurance companies; and 17 percent by subscribing banks.<sup>5</sup> Indeed, according to *BankAmerica Corporation*, the number of nonbank institutional investors in bank loans, including prime rate mutual funds, hedge funds, and insurance companies, increased from 14 in 1993 to more than 100 in 1998. These investors have played a pivotal role in enhancing the bank loan as a distinct asset class by increasing trading activity, demanding third-party loan ratings, and contributing to the development of loan derivative products.

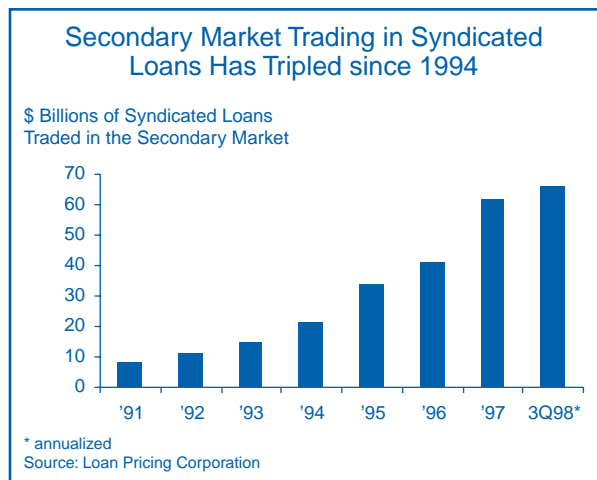

Perhaps the most important new development in syndicated lending has been the deepening secondary market for bank loans as many new investors seek to purchase them. As shown in Chart 1, the volume of secondary trading in bank loans has grown sharply, more than tripling between 1994 and 1997 to over \$60 billion. Trading in 1998 through the third quarter was on pace to top the 1997 level. Traded loans are often non-investment-grade issues, which have been the focus of most demand by the burgeoning institutional investor base. One important force behind the development of a bank loan secondary market has been rapid expansion in the number of bank loans rated by third-party rating services.

Independent credit ratings of bank loans were initiated in 1995 when “several years of rapid development in the

<sup>4</sup> The shared national credit program is a cooperative examination program conducted by the three federal banking agencies and cooperating state agencies to review large, complex credits held at multiple institutions. Loans subject to review are syndicated loans or groups of loans and commitments of \$20 million or more shared by three or more supervised institutions.

<sup>5</sup> “Concerns Mounting Over Risks in Booming Syndication Market,” *American Banker*, January 29, 1997, p. 20.

CHART 1

syndicated bank loan market generated a critical mass of interest in the credit characteristics of these instruments.”<sup>6</sup> *Standard and Poor's*, *Moody's*, *Duff and Phelps*, and *Fitch/IBCA* are now actively involved in rating bank loans. Through 1997, Standard and Poor's and Moody's combined rated \$677 billion in loans. As rating activity increases access to and availability of standardized analysis and research for bank loans, including market analysis, ratings criteria, and historical loss recovery rates, investors are becoming more comfortable with loans as a distinct asset class. Moreover, independent loan ratings allow investors to value a company's loans relative to its other rated loans or bonds.

Bank loan secondary market activity and independent ratings have prompted the development of new ways to package and improve the market acceptance of these assets. As a result, the securitization of bank loans and the development of various types of derivative products have proliferated. As discussed in “CLOs Lure Another Major Bank Asset off the Balance Sheet,” in *Regional Outlook*, third quarter 1998, collateralized loan obligations (CLOs) are a major market development allowing for the securitization of corporate loans. A large investor appetite for varied types of asset-backed securities and a desire to move assets off the balance sheet to lower risk-based capital requirements have helped promote a sharp increase in this type of securitization. Loan derivatives also may allow lenders to better manage the trade-off between maintaining borrower relationships and avoiding excessive concentrations of risk. This trade-off has become increasingly

<sup>6</sup> “Bankrupt Bank Loan Recoveries,” *Moody's Investor Service*, June 1998, p. 5.

CHART 2

important with the trend toward one-stop shopping in financial services.

**One-Stop Financial Providers**

For several years, analysts have noted a trend toward financial services supermarkets—financial institutions positioning themselves as providers of a complete array of advisory services and financial products. One aspect of this trend has been the tendency of traditional lenders to improve their ability to offer a full array of equity and debt underwriting, as characterized by the expansion of Section 20 activities among major U.S. commercial banking companies. Traditional securities underwriters view entry into the syndicated loan market similarly. For example, no investment bank had a syndicated loan underwriting department in 1994, but several are now making inroads into the market, especially the leveraged market, and some increased their syndicated loan volume fivefold in 1997.<sup>7</sup> In some cases, the desire of commercial banks to move toward one-stop financial services and the resulting approaches to relationship management have affected the underwriting of loans to large commercial borrowers that have multiple financing and advisory service needs.

**Historical Perspective on Syndicated Loan Underwriting Trends**

Increased interest by investors in bank loans and strong competition for business resulted in syndicated lending

<sup>7</sup> “The New Kids in the Syndicate: Investment Banks Are Moving in on the Leveraged Syndicated Loan Market,” *Bloomberg*, March 1998, p. 35.

CHART 3

at historically narrow spreads and on more liberal terms. Accordingly, the syndicated loan market was a borrowers’ market for much of the 1990s. As shown in Chart 2, the volume of syndicated loan originations increased almost fivefold between 1991 and 1997, with record volume levels achieved in each of these years. Much of the volume was driven by growth in the origination of loans for the purpose of refinancing existing debt, especially from 1995 to 1997, as borrowers took advantage of increased lender competition and investor demand to reduce funding costs and extend maturities. In some cases, borrowers were able to refinance loans obtained just months earlier at significant savings and more favorable terms.

Chart 3 shows that lending spreads compressed sharply from 1993 to 1997, particularly for lower-quality credits. LPC stated that “[e]xcessive competition has driven spreads and fees to all-time lows, with the investment grade market purely a relationship play.”<sup>8</sup> Consistent with the financial supermarket concept discussed above, as relationship lending proliferated, many lenders were evaluating transactions on the basis of overall relationship returns rather than individual transaction returns. Consequently, borrowers willing to offer an institution ancillary business, such as cash management, securities underwriting, or securitization services, were likely to receive more favorable loan pricing than borrowers seeking to execute just one loan deal.

During the same period, a clear trend toward weakened underwriting resulted in deteriorating risk/return rela-

<sup>8</sup> Loan Pricing Corporation, *Gold Sheets*, First Quarter 1995 Review, p. 9.

CHART 4

tionships across syndicated lending categories. Financial indicators market analysts use to evaluate whether lenders are being adequately compensated for risk generally weakened. For example, the ratio of debt to earnings before interest, taxes, depreciation, and amortization rose to relatively high levels for an increasing number of leveraged and highly leveraged loans.<sup>9</sup> Moreover, lengthening maturities reflected looser underwriting. A decline in the spreads between loans of one-year and five-year maturities made it cost-effective to borrow for longer periods. LPC indicated that the differential between fees on undrawn 364-day revolving loans and undrawn five-year loans had dropped by one-half during this period.<sup>10</sup> As a result, many borrowers extended maturities on new credits, and, as shown in Chart 4, the average maturity of investment-grade loans originated in the mid-1990s lengthened significantly.

### **Recent Underwriting Developments**

Beginning in late 1997, lenders and investors began to resist aggressively priced investment-grade and near-investment-grade loans. This resistance led to a leveling of pricing, fewer refinancing opportunities for borrowers, and increased focus on the higher-risk leveraged lending market, where nonbank institutional investor demand was strong and pricing was richer. In response, overall syndicated lending volume declined almost 16 percent during the first three quarters of 1998 compared with the same period in 1997. However, within total new syndicated loan volume, leveraged loan origina-

<sup>9</sup> Ibid., pp. 16-17.

<sup>10</sup> Ibid., p. 43.

CHART 5

tions grew 77 percent to \$200 billion during the same period, accounting for approximately one-third of all syndicated credits—the largest proportion of the market since 1989. Of particular note was that this growth in higher-risk lending came at a time when losses in speculative-grade bonds had been trending higher and growth in profits for nonfinancial U.S. corporations had been slowing (see Chart 5).

Global economic turmoil and the flight to quality that disrupted the capital markets during the third quarter of 1998 spilled over into the bank loan market and solidified a shift to a lenders' market. LPC noted in its third-quarter 1998 review of syndicated lending that "[r]ates and fees are on the upswing meaning opportunistic refinancings...continue to dwindle. Concessions suddenly are going to lenders rather than borrowers, and volume continues the drop [from levels] seen earlier in the year."<sup>11</sup> Growth in leveraged lending also declined sharply as the number of institutional investors in the market fell by one-half from the second quarter.<sup>12</sup>

The shifting dynamics of the market in late 1998 were characterized by the aforementioned slowdown in originations, a sharp increase in pricing (see Chart 3, previous page), and evidence that underwriting had become more stringent. The volatility in credit markets resulted in deals being rescinded or incorporating "market flex" pricing language that enabled lenders to manage the yield requirements of investors due to changing yields on competing capital markets instruments. The influ-

<sup>11</sup> Loan Pricing Corporation, *Gold Sheets*, Third Quarter 1998 Review, p. 3.

<sup>12</sup> Ibid.

CHART 6

ence of the secondary market on new loan pricing became apparent as investors required underwriters to factor in higher secondary market yields. In addition, as shown in Chart 6, the Federal Reserve Board's November 1998 Senior Loan Officer Opinion Survey on Bank Lending Practices reported that a significant minority of surveyed lenders had tightened lending standards and terms for commercial loans to large and middle-market firms.<sup>13</sup> On net, nearly 40 percent of domestic bank respondents had tightened lending standards for these borrowers for the three months ending November 30, and nearly half had increased pricing. These percentages are the highest reported since the last recession.

Underwriting was also influenced by increased borrower demand for bank loans—a secondary effect of the market volatility in late 1998. The aforementioned Federal Reserve Board survey noted an increased demand for bank commercial loans primarily as a result of shifts from other sources of credit, namely the bond and commercial paper markets. For example, one industry participant estimated that the loan market represented roughly 60 percent of capital market financing in January 1998, 40 percent in July as the high-yield bond market boomed, and nearly 100 percent in September as the bond markets stalled.<sup>14</sup>

<sup>13</sup> Large or middle market firms are those with annual sales greater than \$50 million.

<sup>14</sup> "Syndicated Lenders Swiftly Surmounted September Dip," *American Banker*, December 10, 1998, p. 25.

CHART 7

### *Implications for Insured Institutions*

Although recent evidence suggests that some lenders have tightened standards and terms for loans to large commercial borrowers, market developments and underwriting trends over the past several years have implications for credit quality, earnings, and liquidity at institutions that hold or originate syndicated loans.

- *A slowing economy and stress in industries exposed to weakened international economic conditions could result in increased losses during an economic downturn, especially for banks that are holding higher-risk syndicated loans.* Although nonbank institutional investors hold the bulk of the riskier tranches of syndicated deals, some banks ventured into riskier, longer-term issues in response to narrow pricing on traditional loan pieces held by banks.<sup>15</sup> Should liquidity become an issue in the secondary market, banks planning to sell these pieces may face losses. For example, as reflected in Chart 7, the rolling 52-week total return on the **Goldman Sachs/LPC** Liquid Leveraged Loan Index, which measures the performance of a diversified portfolio of the most actively traded performing leveraged loans, has fallen from over 8 percent in early 1998 to less than 4 percent in December 1998. Falling prices have caused reduced returns as required spreads on these credits have risen.

<sup>15</sup> "Banks Compete with Funds in Buying Long-Term Tranches of Syndications," *American Banker*, March 19, 1997, p. 1.

- *Downstream subscribers that purchased thinly priced or loosely structured loans may not be adequately compensated for risk. This lack of compensation may be especially important for institutions that do not receive ancillary relationship income.* Evidence suggests that downstream lenders became more willing to accept loans during the 1990s without receiving full documentation or making an independent credit analysis. The Office of the Comptroller of the Currency reportedly attributed this trend to a desire to add loan volume coupled with comfort about company prospects because of the strong economy and strong corporate profits.<sup>16</sup> As a result, on a risk-adjusted basis, the returns on these credits may hamper the performance of investing institutions.
- *Sustained reductions in syndicated loan liquidity may adversely affect revenues and increase percentages of loan amounts retained by active syndicating institutions.* If institutional investors remain withdrawn from the loan market for an extended period, syndicates may have increasing difficulty marketing deals, especially in the non-investment-grade segment. As a result, institutions dependent on revenues generated by this activity may face declining income as fewer deals are executed, or they may have to hold larger percentages of undersubscribed transactions. This situation may be further exacerbated by consolidation in the U.S. banking industry, which has combined several major syndicate agents in the 1990s and has reduced the number of potential downstream investment-grade subscribers in the market.
- *Rising demand from borrowers exploiting relative pricing in the loan and capital markets may have credit and liquidity implications for underwriting institutions.* Sustained volatility in the capital mar-

kets may increase the demand for bank loans and will likely significantly increase funding costs for many borrowers. For example, LPC recently compared loans that were extended to seven companies in early 1998 with similarly structured loans extended to the same companies after the third-quarter disruption in the capital markets. The analysis revealed significant increases in required yields, ranging from 112 to 388 basis points.<sup>17</sup> Rising funding costs combined with a trend toward slower growth in corporate profits may reduce loan repayment capacity of borrowers in more troubled industries. In addition, banks that have extended liquidity backstops or backup lines of credit may be required to fund facilities that traditionally are not heavily used by borrowers. For example, without appropriate pricing adjustments, banks providing backup commercial paper loans may be called upon to fund these facilities as a result of volatility and relatively high spreads in the commercial paper market.

Increases in credit spreads on securities and syndicated loans, the recent rise in speculative corporate bond defaults, and slowing corporate profits may portend an increase in commercial credit problems for commercial banks. Now more than ever, those involved in bank risk management should pay close attention to fundamentals, including careful credit analysis, diversification, and maintenance of prudent underwriting standards. Attention to these fundamentals may help alleviate the need to overreact to sudden changes in the market environment.

## Atlanta Regional Perspectives

**Some Atlanta Region real estate markets rank among the nation's most active in terms of new construction.** This high activity level remains consistent with the Region's economy, which has outperformed the U.S. economy for much of the decade. Regional concerns about supply and demand imbalances are primarily associated with the larger, more active markets such as **Atlanta, Charlotte, and Miami**, all of which show large numbers of projects under construction and in the planning stages despite rising vacancy rates.

**Atlanta's commercial construction remains near historic highs, fueling concern that more space may be coming on line than can be absorbed, particularly in retail and office markets.** Annual job growth in Atlanta has fallen from 4.6 percent in early 1998 to 3.1 percent

now, slowing in virtually all areas of the economy except for government. Residential construction also continues to rise, with Atlanta ranked highest in the nation in volume of permits issued during the first half of 1998. Construction and development (C&D) lending at metro Atlanta community institutions is significantly higher than in any other market in the Region. Aggregate C&D lending exposure equaled approximately 13 percent of assets in the second quarter of 1998, a level not seen since the late 1980s. In addition to aggregate exposure that is roughly three times the national average, the *number* of metro Atlanta institutions (28) reporting a C&D concentration above 15 percent of assets is also three times that of any other metropolitan statistical area (MSA) in the nation.

**Population growth, employment gains, and rising per capita income in Charlotte have fueled demand for new office, retail, industrial, and residential space across the seven-county Charlotte-Gastonia-Rock Hill metropolitan area.** Recently, however, the pace of new construction has exceeded absorption in each of these property types, pushing vacancy rates higher. The 21 community institutions headquartered in the Charlotte MSA reported an aggregate C&D loans-to-assets ratio of 5.7 percent in the second quarter, which was above the national average but only about half that reported by Charlotte institutions in the late

1980s. Growth in the **Raleigh** metropolitan area, though moderating, remains well above the national average. Year-over-year job growth in the third quarter of 1998 was 3.4 percent compared with the national average of 2.6 percent. The **Greenville** metropolitan area reports job growth of over 3 percent, primarily from its emergent industries.

**Miami has maintained stable levels of job growth averaging close to 2 percent.** The economy remains closely linked to overseas developments through international trade. Retail construction has been the most active market segment; however, net absorptions accounted for only one-third of new completions in the second quarter of 1998. Consequently, the retail vacancy rate rose to 7.6 percent from 6.9 percent in 1997. Absorption continues to outstrip supply in the office market but vacancy rates remain in the double digits. Despite brisk construction activity, Miami's insured community institutions report relatively low C&D lending exposure of 3.1 percent of assets. **Orlando** remains one of Florida's fastest growing economies, with quarterly year-over-year job growth of almost 5 percent. The Orlando retail market has been among the most active in the nation for regional mall development. **Jacksonville's** strong economic performance continues. Although job growth moderated slightly in 1998, it remains well above 4 percent.

**High-tech industrial and software development continues to foster above-average levels of growth in the Northern Virginia area.** Year-over-year job growth has averaged over 4 percent during the past several quarters. Rapid growth in these industries has sustained high rates of absorption in the office and industrial markets. **Norfolk's** economy continues to perform below the national average in terms of job growth. Office and retail construction starts have risen, while industrial construction starts declined by nearly 50 percent from 1997 levels. Commercial starts, up nearly 40 percent during the first half of 1998, are on track to reach their highest level in 10 years.

**Annual job growth in Birmingham declined to about 2 percent during the first three quarters of 1998.** The **Decatur**, Alabama, metropolitan area is undergoing substantial growth spurred by Boeing's planned building of a large manufacturing facility.

## *Boston Regional Perspectives*

**The Boston Region's insured institutions reported strong results through the third quarter of 1998.** Profitability was driven by the nine organizations with over \$5 billion in banking assets. Their collective return on assets (ROA) of 1.41 percent as of the third quarter of 1998 is 7 basis points higher than the ROA one year earlier. Gains on the sale of assets at one institution were the primary reason for the increase. The Region's remaining 412 insured institutions posted a collective ROA of 1.05 percent, down from 1.14 percent in the prior year and the lowest level of profitability since the third quarter of 1996. Margin compression is the primary reason for the earnings decline.

**Asset quality indicators remain generally favorable, but delinquencies and charge-offs are increasing in credit card and consumer portfolios.** Commercial loan losses also

increased slightly. Credit card loans and commercial loans, sectors evidencing signs of weakness, also have grown rapidly at the Region's larger organizations. Rapid growth has been a precursor to loan problems in the past and bears watching.

**The Boston Region's economy continued to expand at a moderate pace, with the manufacturing sector acting as the principal drag on job and income growth.** In 1997, seasonally adjusted nonfarm employment rose by a monthly average of 15,000 for the Region. This pace slowed during the first 11 months of 1998, with the Region averaging only 7,000 net new jobs per month. A weakened hiring picture in the manufacturing sector caused much of the overall slowing. Seasonally adjusted manufacturing payrolls fell 1.6 percent in New England between year-end 1997 and November 1998.

**Economic growth may slow in 1999, if the manufacturing sector remains weak.** Weakened global consumption and investment resulted in reduced export demand and increased import competition for the Region's manufacturers in 1998. The negative trade picture could have been worse save for a credit crunch in Asia that restrained low-cost exports from flooding into the United States. In addition, significant imbalances in

merchandise trade flows led to disruptions in oceanic shipping lines. However, signs in late 1998 pointed to an easing in the Asian credit crunch, while shipping companies adjusted prices and schedules to accommodate the unbalanced trade flows.

**Given expectations that global demand will remain restrained and that import competition will intensify for U.S. producers, continued weakness in the manufacturing sector's employment picture seems likely this year.** This weakness may raise the risk of consumer and business credit default for some local insured institutions in areas of New England with an above average reliance on manufacturing. These institutions already had reported negative trends by mid-1998. Although they represent only 11 percent of the Region's insured institutions (48 institutions with \$13 billion in assets), they will likely suffer the first effects of an economic downturn and may be a precursor to other, more widespread problems.

**Personal bankruptcies in the Region continue to trend upward.** Bankruptcies in the Region have increased 75 percent since 1994 despite strong economic expansion. Although the rate of growth has been strong, only **Rhode Island** exceeds the national filing rate per 1,000 persons. However, a slowdown in the economy could increase rates further, adversely affecting insured institutions that are heavily involved in credit card and consumer loans.

**Lower interest rates have allowed homeowners to refinance mortgage debt and reduce monthly debt service levels.** Many borrowers have consolidated credit card and other consumer debt into mortgage loans, including those with high loan-to-value ratios. Banks and thrifts may be poised to move into these markets because many nonbank lenders have been forced to curtail their lending activities as a result of a liquidity crunch.

Although there is little evidence of high loan-to-value mortgage lending or subprime origination in the Region's insured institutions at present, institutions should proceed cautiously if undertaking this type of lending, particularly when economic conditions appear to be softening.

## *Chicago Regional Perspectives*

**The Region's economy showed some signs of weakening toward year-end 1998.** Unemployment rates edged up in most states, and output fell in several important manufacturing industries. Meanwhile, low commodity prices trimmed farm income, and farmland prices softened. Such developments raise questions about the strength of the Region's economic growth in the coming year.

**Many manufacturing industries in the Region are responding to slackening domestic and foreign demand, competitive pressures from imports, or both.** Because the manufacturing sector's share of economic activity in this Region is about 50 percent higher than it is nationally, a widespread and sustained weakening among manufacturers could negatively affect many households and communities, with potentially negative implications for their lenders.

**Partly because of waning strength among some major industries, job growth in the Region slowed to 1.3 percent for the year ending in November, lagging the national gain by a percentage point.** Manufacturing employment showed no net gain relative to year-end 1997. Although the Region's unemployment rate remains low, it edged up to 3.9 percent at year-end 1998 from its record low of 3.5 percent in April.

**Significant price weakness persists in the corn, soybean, and hog markets, and the U.S. Department of Agriculture projects continued weakness this year.** This weakness is affecting farmland values in the Region, which fell widely in **Illinois** and **Indiana** during the third quarter for the first time since 1986. Meanwhile, 43 percent of bankers responding to a recent survey by the *Chicago Federal Reserve Bank* indicated that agricultural loan repayments weakened over the past year. Although most of the Region's 500+ farm banks are well capitalized, about 8 percent report both modest earnings (return on assets of 0.91 or less) and reserve coverage of gross loans below 1 percent, which may leave them vulnerable to adverse developments in the farm sector.

**Although most institutions remain financially strong, some are experiencing problems.** Loan delinquencies exceeding 5 percent were reported by 186 institutions (9 percent). However, most of these institutions have relatively strong capital positions. Fifty-eight institutions have composite ratings of 3, 4, or 5, mainly the result of poorly rated management, asset quality, or earnings. Among the 72 unprofitable institutions, 34 have operated for less than five years, 2 are credit card banks, and most of the remainder are small institutions with assets under \$100 million.

**A number of community institutions (those with assets of \$1 billion or less) reported rapid loan growth over the past year.** Fourteen percent expanded their total loans by over 20 percent, and half of these grew their portfolios by 30 percent or more.

Over one-third of the institutions experienced rapid expansion of commercial real estate (CRE) and construction loans. Over half of these institutions also held high concentrations of CRE loans. Although no market in the Region currently shows signs of significant excess space, banks' exposures vary considerably, and local conditions should be monitored for signs of weakening market conditions. Concern arises because CRE projects under way may add new space when the cyclical expansion and demand for space are fading. To the extent that current construction is not preleased, the potentially negative repercussions from a weakening economy on cash flows and owners' repayment abilities are magnified.

**The pervasiveness of rapid loan growth when economic growth is slowing raises questions about how the loans will perform in coming quarters and whether banks and thrifts are taking appropriate steps now to minimize potential problems.** In addition, the Region's banks and thrifts are being affected—and perhaps challenged—by the low and flat interest-rate yield curve and by financial markets' turmoil and volatility during 1998.

## Dallas Regional Perspectives

### **The Region's insured institutions continue to report strong results through the third quarter of 1998.**

Aggregate third-quarter return on assets (ROA) of 1.23 percent and net interest margin (NIM) of 4.34 percent were nearly identical to results reported in the third quarter of 1997. **New Mexico** financial institutions reported an ROA of 0.99 percent at September 30, 1998, down from 1.16 percent at June 30, 1998, and 1.43 percent at September 30, 1997. The primary reason for this decline in profitability is the prospective merger of a large New Mexico bank with an out-of-state bank holding company.

### **The Region's farmers and ranchers experienced the second severe drought in three years this past summer.**

The drought, combined with generally low commodity prices, raised concern over the continued financial health of agricultural producers and the potential effects on insured institutions that serve them. In the Dallas Region, the drought's effects were most extreme in **Texas'** high plains, panhandle, and northeast areas and south central **Oklahoma**, as reported by the *Palmer Drought Severity Index*. As of the third quarter of 1998, the 111 agricultural banks that serve these areas reported no material effects. However, the full effect of the drought may not yet be evident.

**The *In Focus* article in this *Regional Outlook* identifies the Dallas primary metropolitan statistical area (PMSA) as one of the top ten metro markets in the nation in office, hotel, and apartment construction activity as measured against existing space.** The high level of real estate development is not surprising given Dallas' strong economic growth and high levels of immigration during the 1990s. However, economic growth has decelerated somewhat recently because of the effects of international developments on the Region's high-tech and energy sectors. Recent developments in

Latin America and Mexico are likely to slow the Region's export growth further this year. The prospect of slower growth combined with the large numbers of real estate projects in the pipeline increases the potential for overbuilding in the Dallas PMSA.

**Real estate activity is significant to Dallas Region banks and thrifts, as commercial real estate (CRE) loans averaged 23.7 percent of gross loans as of September 30, 1998, significantly higher than the national average of 16.2 percent.** Fifty-four community banks and thrifts headquartered in the Dallas PMSA have significant CRE exposures. CRE exposure for Dallas PMSA institutions has risen in the aggregate by more than 115 percent over the past three years.

**The two real estate segments that have experienced the highest growth in the Dallas PMSA are the office building and residential markets.** Since peaking in the late 1980s and early 1990s at over 25 percent, office vacancy rates in the Dallas PMSA have trended downward to just over 14 percent at year-end 1997. On the basis of large amounts of office space expected to be coming onto the market, **CB Commercial** projects office vacancy rates in the Dallas PMSA to increase to over 18 percent during the next two years. A substantial amount of real estate investment trust activity has been a major funding source for real estate development in the Dallas PMSA.

**International trade has become a major growth engine for the Dallas Region this decade.** The Region's exports grew 62 percent from 1993 to 1997, with Texas the second-largest U.S. exporter of merchandise in 1997. Mexico is the Region's largest export market, accounting for nearly 30 percent of its exports. The Region's exports showed signs of weakening as 1998 progressed; however, its strong trade relationship with Mexico and Latin America offset weakness in Asian exports. Mexico's economy, however, is expected to slow in 1999, and continued Asian economic weakness suggests that exports in the Region will slow in 1999.

## Kansas City Regional Perspectives

**The Region's economy remains fundamentally strong, with a low unemployment rate of 3.5 percent.**

The Region's economy showed evidence of slowing growth in the second half of 1998, as annualized employment growth in the third quarter slowed to 1.9 percent, compared with 2.4 percent in the first half of the year and 2.4 percent in 1997. This slowing was even more pronounced in the Region's manufacturing sector, which grew only 1.2 percent during third-quarter 1998, compared with 2.2 percent in the first half of 1998 and 1.8 percent in 1997.

**Community banks in the Region with less than \$250 million in assets continue to operate in sound condition.**

Earnings through the first nine months of 1998 remain solid, with an aggregate return-on-

assets ratio of 1.31 percent, with stable margins and moderate provisions for loan losses. Capital levels are strong, and loan loss reserves adequately cover very moderate levels of problem loans. Liquidity, which continues to tighten as loan growth outstrips deposit growth, is still a concern in community banks.

**The Region's farm economy is expected to continue to endure financial stress in 1999, as farm income is expected to decline.** In November 1998 the *U.S. Department of Agriculture* (USDA) forecasted net farm income for 1998 at \$48 billion, down \$1.8 billion from 1997 and \$5.3 billion less than the record level of 1996. Commodity price forecasts by the USDA suggest that farm income in 1999 will be below the 1998 level.

**Following significant declines in 1998, prices for each of the major field crops are expected to be even lower in 1999.** Near-record yields for corn and soybean crops coupled with weakened export demand resulted in significant accumulation of inventories, thus depressing prices. Continuing low prices in the wheat market present perhaps the greatest risk in the Region's agricultural sectors. Two successive years of large crops in the

United States and abroad have resulted in large accumulations of inventories.

**Hog prices are expected to remain low, but cattle prices should improve.** Hog prices have declined more than 35 percent since 1997, and smaller producers unable to meet expenses could be forced out of the industry in increasing numbers. Previously forecasted profitability in the cattle markets did not occur in 1998 because of reduced export demand and a shrinking market share for beef. However, improved pricing is expected in 1999, as analysts predict the smallest cattle herd in 40 years.

**The financial condition of farmers is expected to deteriorate significantly if prices do not improve in 1999 and 2000.** A recent *Iowa State University* study projected that one-third of the farms in the study would experience financial distress if low prices persisted. The conclusion could apply to much of **Minnesota, Missouri, and Nebraska**, where corn, soybeans, and hogs are important commodities. Farm banks' asset quality, earnings, and liquidity could be affected if low prices persist.

**The depressed agricultural economy and falling commodity prices are negatively affecting land prices.** Declines in land values have been reported in **Iowa, North Dakota, Kansas, Missouri, and Nebraska**. Farmland prices have not declined since the mid-1980s.

**Kansas City's retail real estate sector appears to be in the "oversupply" phase of the real estate cycle.** Declining consumer confidence, increasing vacancies, and rising capitalization rates are signs of potential weakening in **Kansas City's** retail real estate sector. The vacancy rate has risen steadily since 1995, although it still remains below the national average of 7.4 percent.

**Community banks in the Kansas City area have participated in the recent real estate development, adding nearly \$80 million in loans in the past 24 months.** These banks may see higher delinquencies and eroding collateral positions as vacancies rise and cash flow falls.

## Memphis Regional Perspectives

**The Memphis Region economy is slowing.** Only 7,000 nonagricultural jobs were added in the third quarter of 1998, the smallest gain since the 1991 recession. The slowdown in employment growth occurred across most industries, led by job losses in the nondurable manufacturing sector.

**The Region's agricultural sector has suffered because of low commodity prices and adverse growing conditions.** The lower Mississippi Delta states were affected most severely, with lower yields and production reported for most crop types.

Because of high ending stocks and weak demand forecasts, prices are expected to remain depressed through 1999 and possibly longer, barring weather-related supply shifts.

**Southern Louisiana's economy remains vulnerable to weaknesses in the oil sector.** The industry has reported layoffs, and more will likely follow if oil prices remain low. While large companies with deep pockets can operate at a loss for prolonged periods, smaller companies that are unable to operate below the typical \$14 to \$16 per barrel break-even range for a sustained period have an uncertain future.

**Worldwide demand and consumer buying preferences are contributing to diverging production among the Region's automobile manufacturers.** Concern over excess productive capacity in the automobile industry has been magnified by the slowdown in world economic growth. In particular, the slowing of the Japanese and Korean economies and weakness in their currencies have resulted in more of their automobiles being offered at lower relative prices. In addition, low gasoline prices have been partly responsible for a shift in demand away from smaller passenger vehicles produced at Nissan and Saturn plants in Tennessee and toward sports utility vehicles and trucks produced in Kentucky.

**Banking conditions remain positive, but earnings performance in the third quarter was dampened somewhat by lower net interest margins (NIMs).** The

### EARNINGS PERFORMANCE HAS DECLINED

AVERAGE	SEP-97	SEP-98
RETURN ON ASSETS	1.18	1.13
NET INTEREST MARGIN	4.58	4.40

SOURCE: BANK & THRIFT CALL REPORTS

average return on assets (ROA) for the quarter was down 5 basis points from both the third quarter of 1997 and the second quarter of 1998 because of lower average NIMs. The decline in NIMs is primarily attributable to the flattening of the yield curve and increased competition.

**Metropolitan commercial real estate markets in the Region are active, and segments of specific markets may become vulnerable to overbuilding.** Some local economies have begun to cool, and demand for commercial space is softening. Additional slowing in local or national economic conditions could lead to greater supply and demand imbalances.

In 1997, Nashville reported the highest level of commercial construction starts in over a decade, and this trend continued into 1998. This surge in construction is occurring in all market segments, but slowing office employment growth and declining tourism have led to rising vacancy rates in both the office and hotel market segments. The Memphis office and apartment markets report flattening rental rates resulting from high completion levels and appear vulnerable to overbuilding. The New Orleans hotel market is also weakening.

**Financial institutions report growing exposure to real estate markets, as average commercial real estate loans have increased to 25.1 percent of total loans.** Construction and development loans have risen from an average of 4 percent of total loans at the end of 1991 to 7.2 percent as of September 30, 1998. Anecdotal evidence suggests that commercial real estate underwriting standards have eased in recent years, primarily because of increased competition. Increased lending exposure and generally weaker underwriting standards combined with greater inherent risk in commercial real estate present conditions that managers of insured financial institutions should monitor closely.

## *New York Regional Perspectives*

**The New York Region's economy continued to expand at a moderate but sustained pace.** Most areas of the Region are experiencing job growth and low unemployment. In the first three quarters of 1998, the Region added 290,000 new jobs, an increase of 1.4 percent over the same period one year earlier. Yet, as has been the case for several years, the Region's payroll employment growth rate is still only about one-half the nation's rate.

**Economic crises in Southeast Asia and Russia and their contagion effects continue to affect the U.S. and the Region's economies.** Currency devaluations and weakened demand from abroad are taking a toll on American manufacturers that export to Asia and other emerging markets. Trade statistics through October released by the *Census Bureau* show that manufactured exports from the Region declined from a similar period in 1997. Exports from the rest of the nation were essentially flat. If an economic crisis occurs in Latin America, the Region's exporters could be harmed further.

**The Region's banks and thrifts reported generally healthy financial conditions in the third quarter of 1998.** The Region's average return on assets (ROA) was 1.03 percent, about the same as a year earlier. The average net interest margin (NIM), which fell to 4.05 percent in the third quarter from 4.19 percent a year earlier, continued to narrow as a result of a flat yield curve. However, the yield curve steepened somewhat in the fourth quarter, suggesting that the NIM will stabilize or possibly rise in the next few quarters.

**The Region's community banks (those with assets of less than \$250 million) continue to report weaker earnings, on average, than their larger counterparts.** The average ROA among this group was 0.84 percent as of September 30, 1998, almost 50 basis points below the ROA for institutions with assets greater than \$250 million.

**Some major money center banks in the Region reported significant reduction in earnings as a result of global market turmoil.** In the first quarter of 1998, significant charge-offs were taken as a result of

the Asian financial crisis. Many large banks reported additional credit charge-offs and trading losses in the third quarter resulting from the economic collapse of Russia.

**Most commercial real estate markets in the Region remain fairly subdued compared with other markets in the United States** An analysis by *Legg Mason Wood Walker* shows little supply and demand stress in the Region's office markets. In a few markets, however, office construction activity has been increasing and rents have been rising as a result of stronger demand.

**Trends in the Philadelphia area's office market suggest that overbuilding may be possible in the next few years.** Through only the second quarter of 1998, office construction surged to 2.2 million square feet, surpassing annual levels since 1992. In the **Baltimore** area, office construction was up 79

percent annually in the first half of 1998. A recent *Lehman Brothers* report places Baltimore on a list of markets susceptible to increasing vacancy rates in 1999. In **New York City**, a strong economy and the lack of major new office construction projects over the past several years have driven vacancy rates to more than a ten-year low, while office rents have skyrocketed. Because of the limited number of new office building completions and the area's strong economy, **Wilmington** has experienced a decline in office vacancy rates from 24 percent in 1991 to 6.3 percent in the second quarter of 1998.

**Puerto Rico is recovering from heavy damage caused by Hurricane Georges in September 1998.** *Caribbean Business* estimates that the total amount invested in rebuilding the island's infrastructure could reach \$6.5 billion in 1998. Because only 30 to 40 percent of homeowners have hurricane insurance coverage, Puerto Ricans are relying on federal aid to provide relief. The agricultural sector was hard hit, and it will take some time to recultivate lost crops.

## San Francisco Regional Perspectives

**Four markets in the Region have experienced significant commercial real estate growth in recent years: Las Vegas, Phoenix, Portland, and Salt Lake City.** Community banks with construction and development (C&D) loan concentrations are now more common outside California than they are in California. Community banks in Las Vegas, Salt Lake City, and Portland have especially high exposures to C&D lending.

**The Las Vegas metropolitan statistical area (MSA) is the most active construction market in hotel, office, and industrial space of the nation's major metropolitan markets.** Retail space development also is among the strongest in the nation. Although Las Vegas remains one of the Region's fastest-growing MSAs,

the area's growth is heavily dependent on the hotel and gaming sectors, which directly account for over 25 percent of the MSA's employment. The *National Real Estate Index (NREI)* estimates that in order to absorb the substantial additions to the hotel stock, visitor count must increase significantly by the year 2000, which may not occur given that the annual visitor count through November 1998 has been flat. Las Vegas' office market also may be oversupplied. The NREI attributes the pressure on both rents and vacancy rates from increased office development to speculative construction activity. Vacancy rates of 14.3 percent are well above the national average, having risen for the fourth consecutive year. While several insured depository institutions operate in the Las Vegas MSA, the 11 community banks headquartered in Las Vegas could be harmed most by a slowdown in the area's economy because of their relatively high exposures to C&D lending and their dependence on local real estate markets. Aggregate C&D loans equal 12.7 percent of total community bank assets in the MSA.

**Preparation for the 2002 Winter Olympics, in conjunction with past growth in the high-technology industry, helped propel Salt Lake City to one of the top three U.S. commercial real estate markets in office, industrial, and hotel development.** Despite its past rapid growth, some general economic indicators suggest that Salt Lake City may be slowing down. The

pace of economic activity declined markedly in 1998, with job growth slipping to 2.5 percent. Salt Lake City's community banks have the highest exposure to C&D loans of the four metropolitan markets discussed in this article. Although the C&D loan growth rate has slowed from 49 percent for 1996 to less than 1 percent through third-quarter 1998, C&D loans for Salt Lake City community banks remain at a high 15.2 percent of total assets, almost triple the 5.7 percent figure for the Region.

**Portland's office, hotel, and industrial markets appeared to be at or near the top of the commercial real estate business cycle in 1998.** Portland's economy and job growth have been slowing like those of **Oregon**. Before 1998, Portland's office market had been robust, with a steady rise in new construction activity, rapid absorption of new properties, and declining vacancy rates. However, *Coldwell Banker Commercial/Tortowheaton Research (CBC)* notes that, as the economy has begun to slow, Portland's new office supply may begin to outstrip demand.

**Community banks in the Portland MSA have much higher exposure to construction and commercial real estate lending than do their peers in the Region.** C&D loans account for 9.2 percent of their total assets as of September 30, 1998, much higher than the comparable figures of 5.7 and 3.3 percent for the Region and the nation, respectively.

**The Phoenix MSA is in the top ten nationally in the development of industrial, hotel, and retail space.** Strong employment growth in the technology sector over the past decade has made Phoenix susceptible to global developments affecting this industry, and the Asian financial crisis is beginning to affect technology employment. The Phoenix MSA was ranked sixth among the 54 CBC markets in retail space growth from 1990 to 1997. Retail vacancy rates, currently above the national level of 8.1 percent at 10.3 percent, are expected to remain close to this level through the year 2000.

Although the 29 community banks in the Phoenix MSA have grown their C&D portfolios significantly in the past several years, their exposure to C&D loans remains well below that of similar-sized institutions in Las Vegas, Salt Lake City, and Portland.
