In Focus This Quarter

◆ Economic Conditions and Emerging Risks in Banking—This article provides an overview of economic conditions and banking industry trends, with a primary focus on potential risks to insured depository institutions.

◆ Indicators of Industry Performance—The reported financial condition of insured banks and thrifts is strong. However, despite projected growth in earnings, bank and thrift stocks underperformed the broader market through October 1999. See page 3.

◆ Economic Conditions—The economy remains generally strong, and the outlook calls for continued growth. Growth is likely to slow, however, in order to correct financial imbalances that have developed as a result of a rapid creation of household and commercial credit and borrowing from abroad. There is a threat that the adjustment process could be a volatile one. See page 4.

◆ Emerging Risks in Banking—Rising indebtedness on the part of businesses and households raises concerns about future loan performance. Industry responses to intense competition have created greater credit, market, and operational risks. See page 8.

Consumer Lending—Banks and thrifts are becoming increasingly involved in subprime consumer lending, which has raised some supervisory concerns. See page 8.

Commercial and Industrial Lending—Signs of deterioration in corporate credit quality can be found in rising loss rates, slower profit growth, and rising corporate bond defaults. At the same time, banks are expanding their lending to heavily indebted companies in the syndicated loan market. See page 11.

Commercial Real Estate and Construction Lending—Loans for real estate construction and development are growing rapidly. Despite an uptick in commercial vacancy rates, loan losses remain low. See page 12.

Agricultural Lending—Low commodity prices are hurting farm operating incomes, but widespread effects on farm banks have yet to materialize. See page 13.

Funding and Interest Rate Risk—Lagging deposit growth has led to a greater reliance on more volatile, market-based funding, and some institutions are taking on greater interest rate risk to maintain loan growth. See page 14.

By the Analysis Branch Staff

Regional Perspectives

◆ Economic and Banking Conditions—Weakness in the aerospace, manufacturing, energy, and agricultural sectors continued to limit the Region’s growth, which was slower through July 1999 than during 1998. Nevertheless, the strong services and construction sectors buoyed the Region’s performance, which exceeded the national growth rate for the same period…Despite generally strong banking conditions, mortgage and agricultural lenders in the Region reported declines in performance, and commercial lenders increased holdings of traditionally higher risk assets…Low prices for many agricultural commodities and declining farm income in some states negatively affected farm banks in the Region, particularly in Montana…While earnings and capital levels at the Region’s farm banks have declined only slightly, asset quality in the second quarter of 1999 was at its lowest level for that period in the past five years. See page 18.

By the San Francisco Region Staff
The Regional Outlook is published quarterly by the Division of Insurance of the Federal Deposit Insurance Corporation institutions and financial institution regulators. It is produced for the following eight geographic regions:

- Atlanta Region (AL, FL, GA, NC, SC, VA, WV)
- Boston Region (CT, MA, ME, NH, RI, VT)
- Chicago Region (IL, IN, MI, OH, WI)
- Dallas Region (CO, NM, OK, TX)
- Kansas City Region (IA, KS, MN, MO, ND, NE, SD)
- Memphis Region (AR, KY, LA, MS, TN)
- New York Region (DC, DE, MD, NJ, NY, PA, PR, VI)
- San Francisco Region (AK, AZ, CA, FJ, FM, GU, HI, ID, MT, NV, OR, UT, WA, WY)

Single copy subscriptions of the Regional Outlook can be obtained by sending the subscription form found on the back cover to the FDIC Public Information Center. Contact the Public Information Center for current pricing on bulk orders.

The Regional Outlook is available on-line by visiting the FDIC’s website at www.fdic.gov. For more information or to provide comments or suggestions about the San Francisco Region’s Regional Outlook, please call Catherine I. Phillips-Olsen at (415) 808-8158 or send an e-mail to cphillips-olsen@fdic.gov.

The views expressed in the Regional Outlook are those of the authors and do not necessarily reflect official positions of the Federal Deposit Insurance Corporation. Some of the information used in the preparation of this publication was obtained from publicly available sources that are considered reliable. Economic Conditions and Emerging Risks in Banking

The Division of Insurance periodically assesses conditions in the economy and the banking industry to identify and evaluate trends that could adversely affect the performance of insured depository institutions. Overall, conditions in the economy and banking industry are favorable at this time. However, signs point to vulnerability in the economy and in the banking industry that may make the years ahead much more challenging. Three broad themes emerge from this assessment:

- **Households’ and businesses’ debt levels are on the rise.** Spending by households and businesses is growing faster than cash income, resulting in rapidly increasing indebtedness. Consumer spending has been driven, in part, by large increases in the net worth associated with stock holdings and home equity. Businesses are restructuring and investing in new technologies to raise productivity and cut costs. Both consumer and business spending has been assisted by ready access to financing. Rising interest rates or slower economic growth could make debt service more difficult for borrowers.

- **Intense competition in banking is driving business strategies.** Competitive pressures have affected nearly every facet of the banking business. These pressures are evident in net interest margins, which have suffered from tighter loan pricing and higher funding costs. To maintain profits, some institutions are lending to less creditworthy borrowers, expanding into new or higher-yielding activities, creating more complex balance sheet structures, or cutting costs. These strategies may lead to greater credit, market, and operational risks.

- **The currently benign economic environment is vulnerable to rapid deterioration in the event of financial market instability.** During the 1990s, we have witnessed recurring, and perhaps more frequent, episodes of financial market turbulence. Recent episodes have arisen mainly overseas and have had little adverse effect on U.S. economic activity. However, the current economic expansion is closely tied to the ready availability of market-based financing for households and businesses and to wealth generated with the help of rising stock prices and falling interest rates. For this reason, the currently strong economic outlook may be subject to sudden deterioration in the event of market shocks that sharply raise interest rates or lower stock prices.

The analysis that follows explores these themes in more detail in the following sections: 1) indicators of industry performance, 2) economic conditions, and 3) emerging risks in banking.

Indicators of Industry Performance

**Industry Financial Performance Is Strong**

According to reported financial information, the banking and thrift industries are performing well. As summarized in the *FDIC Quarterly Banking Profile*, second quarter 1999, both the commercial banking and thrift industries report near-record earnings, strong capital levels, and manageable volumes of problem assets and loan losses. Return on assets (ROA) for all insured institutions in the second quarter was 1.21 percent and return on equity (ROE) was 14.07 percent. ROA and ROE were down slightly from the first quarter despite improvement in the industry net interest margin (NIM) and a decline in provision expense. However, the majority of the decline in net earnings resulted from a $1.5 billion loss posted by one large bank.

The low overall level of net loan losses has been a key contributor to strong industry performance. Chart 1 (next page) shows that the average net loan loss ratio for the industry has been low and stable in recent years. Similarly, the range between the worst and best 5 percent of net loan loss ratios has narrowed considerably since the early 1990s. More than 95 percent of insured institutions reported a net loan loss ratio of less than 1 percent in 1998, continuing a five-year trend.
Bank Stocks Underperform Despite Projected Earnings Growth

Analysts expect continued earnings growth for banks and thrifts in 1999 and 2000. Median growth in earnings per share is projected to be 16.9 percent for publicly traded banks and 19.4 percent for publicly traded thrifts for 1999.¹ Ratings agencies also view the industry positively. The ratio of upgrades to downgrades for ratings issued by Moody's Investors Service improved in the second quarter, with nine companies receiving upgrades versus four receiving downgrades.

Nonetheless, bank and thrift stocks have underperformed the broader market in the first three quarters of 1999. The SNL Securities Bank Stock Index, which tracks more than 450 publicly traded commercial banks, declined 6.7 percent between January 1 and September 30, 1999. The SNL Securities Thrift Stock Index, which tracks the performance of about 350 publicly traded thrifts, fell 13.7 percent during the same period. By contrast, the Standard & Poor's (S&P) 500 index gained 4.6 percent. Analysts cite rising interest rates, concerns about problems with corporate credit quality, and a decline in bank merger activity as reasons for the recent performance of bank and thrift stocks.

Economic Conditions

Overview

The U.S. economy has remained generally strong during 1999, the ninth year of the current economic expansion. If growth continues through February 2000—as most analysts expect—this expansion will become the longest in U.S. history. What is also remarkable about this business cycle expansion is the fact that the highest rates of growth have occurred during the past two years, 1997 and 1998. Even as growth has accelerated with unemployment declining to 4.2 percent, wage and price inflation has remained unusually subdued. While low inflation has helped prolong the expansion, it has imposed intense price competition on a wide range of industries. The currently positive economic outlook is subject to possible sudden deterioration in the event of financial market shocks that could raise financing costs, reduce the availability of financing, or destroy investor wealth.

Commodity Industries Have Faced Pricing Pressures

One disadvantage of low inflation during this expansion has been that firms in certain commodity industries have suffered from falling prices. Profit margins have declined in agriculture, mining, and some manufacturing sectors because of weak or negative revenue growth during 1997 and 1998.² Firms operating in these industries have aggressively cut costs to preserve profit margins. Nonetheless, profit growth has been flat or negative for a large proportion of S&P 500 firms in the mining, textiles, chemicals, iron and steel, and oil and gas sectors since 1997. In response, some firms in these industries have chosen to consolidate through mergers. According to Mergerstat, the dollar volume of merger and acquisition transactions involving U.S. firms was a record $1.2 trillion in 1998, more than 80 percent above 1997 levels.

Business Investment Is Outpacing Cash Flow

Analysts recently have become concerned about increasing levels of debt on corporate balance sheets.

¹ Based on estimates as of November 4, 1999, for 98 commercial banks and 33 thrifts that have at least five analyst estimates.
Chart 2 tracks the steady growth of fixed investment by U.S. corporations during the current expansion. It also shows, however, that growth in cash flow available to finance investment has slowed in recent years. This “financing gap” has grown steadily, reaching a record $86 billion in 1998.

As a result, corporations must finance an increasing portion of investment spending by issuing either net new equity or net new debt. In recent years, firms have overwhelmingly chosen debt financing. Net issuance of corporate debt was $219 billion in 1998, while corporations repurchased equity shares on net for the sixth straight year. Corporate borrowing has also continued at a brisk pace; domestic commercial and industrial (C&I) lending rose by 12.5 percent in the year ending June 1999.

A widening financing gap and increasing debt levels could pose future problems if there are adverse changes in the financial environment. For example, a sharp rise in interest rates would increase the debt burden of businesses, hurt their profitability, and impair their creditworthiness. Under such a scenario, firms might decide to curtail their capital expenditures, which would tend to reduce the rate of growth in the rest of the economy.

**Consumer Spending Continues to Grow**

Strong growth in consumer spending continues to propel the economic expansion. Spending has accelerated in recent quarters, in contrast to previous expansions when the strongest growth in consumer spending occurred early in the recovery. One factor supporting the robust pace of spending is housing activity. Single-family housing starts rose to an annualized rate of more than 1.3 million units in fourth quarter 1998 and have remained near that level through third quarter 1999. Existing home sales also have maintained a record pace of 5.3 million units on an annualized basis during the second and third quarters. Low mortgage interest rates and real income gains have combined to push housing affordability to its highest level in many years.¹

Rapid growth in consumer spending also warrants attention. Despite the highest rates of real income growth in nine years, consumer spending has grown more quickly than disposable personal income. The divergence in growth has resulted in a falling personal savings rate, which reached a record low in 1999.² The recent decline in the personal savings rate continues a trend that has been under way for more than a decade (see Chart 3, next page).³

Analysts cannot fully explain the reasons for the falling savings rate, although the “wealth effect” associated with the accumulation of capital gains by households is believed to be a significant factor. Since 1995, the total value of equities, mutual funds, and pension funds owned by households has risen by $6.8 trillion, while the value of owner-occupied housing net of mortgage debt has increased by $812 billion. This accumulation of wealth apparently has emboldened consumers to spend, as evidenced by data that show aggregate spend-

¹ Personal savings is calculated as the difference between disposable personal income (DPI, or total income net of taxes) and consumption expenditures. The personal savings rate is equal to personal savings divided by DPI. It should be noted that capital gains, even when realized, are not included as income in this calculation, although taxes paid on capital gains are deducted from DPI. Consequently, large-scale realization of capital gains by households will tend to push down the personal savings rate.

² The Bureau of Economic Analysis, which tabulates the personal savings rate, has recently revised its methodology, leading to a large revision in the savings rate data. Earlier estimates reported the personal savings rate to be around negative 1 percent, suggesting that households were spending more than their disposable (after-tax) income. Revised estimates show that the savings rate for the third quarter of 1999 was 2.1 percent. Although higher than previously reported, the revised personal savings rate data continue to show a downward trend similar to earlier savings rate estimates.

³ The housing affordability index published by the National Association of Realtors equals 100 when the median family income qualifies for an 80 percent mortgage on a median-priced existing single-family home. The value of the index as of the third quarter of 1999 was 127.1.
ing growth exceeding income growth. For the most part, when consumers have chosen to convert capital gains to spendable cash, they have done so by borrowing—often against the equity in their homes or their 401(k) accounts.

The increasing indebtedness of consumers could substantially raise the costs of debt service relative to income, especially if interest rates rise or income growth slows. Moreover, analysts express concerns about a reversal of the wealth effect if there is a significant and sustained decline in equity prices. Any resulting decline in consumer confidence could substantially slow the pace of consumer spending, leading to a reduced pace of economic growth.

The Growing Private Deficit Raises Concerns

Taken together, the sum of annual net borrowing by businesses and households has been referred to as the “private deficit.” During the late 1990s, as the combined budget of federal, state, and local governments moved from deficit to surplus, the private deficit rose sharply; between 1996 and 1998, it nearly doubled from $550 billion to $1.02 trillion (see Chart 4).

The private deficit was financed from three sources in 1998. One source was the $73 billion surplus in the government sector, the first surplus in 28 years. The largest portion of the 1998 private deficit was financed by the creation of credit by the domestic financial sector and by an inflow of foreign capital. The rapid creation of credit raises concerns about credit quality, an issue that is explored in more detail under Emerging Risks in Banking, below. Dependence on foreign capital raises questions about what might happen if the foreign sector becomes less willing to export capital to the United States.

Recovery Abroad Is Changing the Terms of Trade

During the past three years, the U.S. economy has experienced consistently strong growth with low inflation, while the economies of some of its major trading partners have grown more slowly or not at all. Japan was mired in its worst recession in decades, while a number of countries in Asia, Latin America, and Eastern Europe...
have experienced the harsh fallout resulting from financial market and exchange rate crises. The euro-zone economies, Germany and France in particular, have grown slowly following the imposition of tight fiscal and monetary policies in advance of the introduction of the euro on January 1, 1999.

The net effect of this disparity in growth rates has been a growing U.S. trade deficit. The deficit rose by 57 percent in 1998 to $164.3 billion, reflecting a small decline in exports and a 5 percent increase in imports. The adverse effects of the trade deficit on the U.S. economy have been felt primarily by the commodity industries—farming, mining, and basic manufacturing. In addition, the large trade deficit has resulted in the transfer of billions of dollars to foreign investors. During 1997 and 1998, many foreign investors used their excess dollars to purchase dollar-denominated stocks and bonds. This inflow of capital helped keep U.S. equity and bond prices high, while pushing up the value of the dollar.

A global economic recovery during the first three quarters of 1999 has led to higher demand for investment capital outside the United States. The International Monetary Fund estimates that growth in the global economy will increase from 2.5 percent in 1998 to 3.0 percent in 1999 and 3.5 percent in 2000. Foreign investors, in anticipation of stronger growth and greater investment opportunities abroad, have started to convert their excess dollar holdings to other currencies, including the yen and euro. This change in investment strategy has put downward pressure on the value of the dollar. Between July and September 1999, the dollar lost approximately 10 percent of its value against the yen.

A falling dollar will likely contribute to a recovery of U.S. exports in coming months. The index of export orders compiled by the National Association of Purchasing Managers points to future growth in shipments abroad. The index has signaled growing export orders for nine months through October 1999. As Chart 5 shows, increasing export orders tend to lead the actual rise in exports by several months.

A lower dollar could also place upward pressure on U.S. inflation and interest rates. A steady decline in the dollar would make foreign goods more expensive, while higher export demand would raise manufacturing output at a time when U.S. labor markets are very tight. The prices of several important industrial commodities have risen in dollar terms during 1999, led by a doubling in the price of oil during the first nine months of 1999. Domestically, the producer price index has risen by approximately 4 percent since the beginning of the year following a two-year decline, reflecting an increase in oil and intermediate goods prices.

Interest rates have risen in step with renewed concerns about inflation. The constant maturity yield on 10-year Treasury bonds increased by approximately 140 basis points in the year ending October 1999, while the Federal Reserve instituted two 25-basis point increases in short-term rates during the summer of 1999.

The Economic Outlook Calls for Continued Growth

One scenario for the year ahead is that the U.S. economy will continue to grow at much the same rate as it has during the past few years. As discussed above, however, continued rapid growth would lead to even greater imbalances in the domestic economy and in the foreign sector. For this reason, most economists do not believe that rapid growth can continue indefinitely. Instead, analysts suggest two possible scenarios for the economy.

The Blue Chip Economic Indicators consensus outlook for the U.S. economy calls for a “soft landing.” Gross domestic product is projected to grow at a rate of 3.8 percent in 1999 with somewhat slower growth of 2.8 percent in 2000. Rising wage pressures, reflecting tight

---

*Blue Chip Economic Indicators, Aspen Publishing, October 10, 1999.*
labor markets across the nation, and economic recovery abroad are expected to increase the risks of higher U.S. inflation. Improving growth prospects in the global economy may also lead to a stabilization of commodity prices, reversing a trend of falling prices that has until recently contributed to lower U.S. inflation. In response to expectations of higher inflation, medium-term interest rates are also expected to rise modestly. Slower U.S. growth and faster expansion abroad would result in a rebalancing of global growth that should narrow the U.S. trade deficit and reduce downward pressure on the dollar.

Although the consensus forecast calls for continued expansion, an alternative scenario suggests the possibility of a steep decline in economic growth leading to a “hard landing.” Sharply higher interest rates, in response to a weak dollar and an unexpected acceleration of U.S. inflation, could lead to declining capital investment and reduced consumer spending. Rising interest rates would increase the debt burden for households and businesses even as measures of indebtedness are rising. A significant and sustained decline in equity prices may occur if investors become pessimistic as the economy slows. The response of the world economy to a U.S. recession is difficult to assess. As the past several months have shown, growth in the U.S. economy has been an important factor in supporting growth abroad. If the U.S. economy were to enter a recession, overall global growth could also slow, depending on the extent to which recoveries in Europe, Asia, and Latin America offset any shortfall in U.S. growth.

**Emerging Risks in Banking**

**Overview**

Favorable economic conditions continue to support strong loan growth and healthy loan performance among insured institutions. Net loss rates remain low relative to the early 1990s for almost every major loan category except consumer loans. Loss rates in domestic commercial loans, previously at low levels, rose modestly during the first half of 1999. Agricultural loan loss rates appear likely to rise in the future due to the effects of weak commodity prices on farm incomes. Strong loan growth and low loan losses have helped banks achieve record and near-record high quarterly profits. However, rising indebtedness on the part of businesses and households raises concerns about future loan performance, particularly if economic conditions were to deteriorate or if interest rates were to rise.

Strategic responses to competitive pressures point to greater credit, market, and operational risks for the industry. Intense competition has pressured NIMs and has encouraged many lenders to seek higher returns by lending to less creditworthy borrowers. In order to maintain and grow profits, some insured institutions are expanding into activities such as subprime consumer lending, high loan-to-value mortgage lending, and lending with minimal or no documentation requirements. Rapid growth in syndicated lending to leveraged companies also indicates that large commercial lenders have increased their tolerance for risk. Competition has made funding with deposits more difficult. As a result, some institutions are relying increasingly on securitizations and more expensive, market-based sources of funds, which can alter an institution’s liquidity position, interest rate risk profile, and operational needs. Institutions have also responded to competitive pressures by cutting costs or merging in an attempt to achieve greater efficiencies. In some cases, deep reductions in operating costs support profits at the expense of less effective operational controls.

**Consumer Lending**

**Household Borrowing Is on the Rise**

Household borrowing is growing rapidly, consistent with high reported levels of consumer confidence and strong consumer spending. Mortgage debt, which grew by 10.4 percent in the second quarter from year-ago levels, is the fastest-growing segment of household debt (see Chart 6). Mortgage loan growth has been particularly strong, in part because of rising homeownership, the availability of more low-down-payment loans, and the use of mortgage loans to consolidate revolving debt balances. Nonrevolving debt grew by 7.3 percent in the year ending June 1999, largely because of strong sales of new cars. In contrast, credit card and other revolving debt increased by only 5.7 percent during the same period—a much slower rate of growth than during the mid-1990s.
A Mortgage Refinancing Boom Has Helped Consumers Consolidate Debt

A key component of the recent shift by consumers from credit card debt to mortgage debt has been a surge in mortgage refinancing in 1998 and early 1999. The Mortgage Bankers Association’s Refinancing Index peaked at over 4,300 in October 1998, compared with an average monthly index value of 527 during 1997. Many households have refinanced their mortgages to obtain cash to pay down credit card and other high-cost consumer debt, thereby lowering their monthly financial obligations. According to a Freddie Mac survey of 1998 refinancing transactions, more than 3 million homeowners, or 51 percent of all mortgage-refinance borrowers, generated net cash proceeds when they refinanced their loans. On average, these borrowers cashed out 11 percent of the equity in their homes. On the basis of this survey, Bank One Corporation estimated that cash out refinancing added about $60 billion in cash flow to consumer pocketbooks last year. This extra cash flow could help explain recent quarterly declines in personal bankruptcy filings, mortgage delinquencies, and consumer credit charge-offs. Rising interest rates appear to have ended this mortgage refinancing boom. The lower volume of mortgage refinancings raises questions about whether consumers again will increase their use of credit cards to finance purchases. If so, there may be negative consequences for future consumer debt service burdens and consumer credit quality.

Credit Card Lenders Face Declining Returns

After several years of rapid growth in the mid-1990s, the credit card industry has become characterized by overcapacity and declining margins. At the same time, the high level of mortgage refinancings and rising household incomes have reduced the dependence of consumers on credit card debt. Consequently, credit card lenders are struggling to maintain volume as consumers pay off their credit card balances more quickly. Overcapacity and declining margins have led lenders to search aggressively for new ways to increase revenues. One method they have adopted is to charge new fees that are triggered by cardholder behavior. Lenders are now charging fees for inactive accounts, fees to close accounts, and even customer service fees. In addition, they are reducing grace periods, curtailing leniency periods, and imposing higher penalty interest rates. According to RAM Research, banks’ income from credit card fees has grown 79 percent over the past two years, while card interest income rose only 10 percent. Shrinking margins have also prompted consolidation in the credit card industry. Today, the top five issuers control about 60 percent of the total managed assets in the credit card sector, up from just 35 percent in 1990. Amid this changing competitive landscape, credit quality has improved. Credit card charge-off levels at insured commercial banks hit an all-time high of 5.5 percent in the third quarter of 1997 but have declined steadily to a level of 4.1 percent in the second quarter of 1999. This decline has been attributed to tighter underwriting standards, more aggressive collection efforts, and extra household cash flow generated through mortgage refinancings.

8 Index is seasonally adjusted where the week of March 16, 1990 = 100.
9 Survey cited in a study by the Joint Center for Housing Studies at Harvard University, “The State of the Nation’s Housing: 1999.”
In Focus This Quarter

Subprime Lenders Have Riskier Characteristics than the Industry

Subprime lending to consumers has grown dramatically in recent years. Subprime mortgage originations have grown from 5 percent of the total mortgage market in 1994 to 15 percent in 1997. The percentage of originations fell somewhat in 1998 to 10 percent—not because the volume of subprime mortgage originations fell but because the volume of prime mortgage originations was at a record high. In fact, in terms of dollars, subprime originations grew by 20 percent from 1997 to 1998, to $150 billion. That figure is up significantly from the $35 billion in subprime originations in 1994. Estimates of the size of the subprime automobile loan market vary somewhere between $50 billion and $75 billion, but one source estimates that subprime automobile originations jumped from about 8 percent of all automobile loan originations in 1990 to over 18 percent in 1998. Analysts also have indicated that the subprime credit card market is the fastest-growing segment of credit card lending today. According to RAM Research, subprime receivables are growing 45 percent annually, compared with 16 percent or less for other segments of credit card lending.

Intense competitive pressure has contributed to the expansion of bank and thrift participation in subprime consumer lending. These loan programs offer higher margins than prime consumer lending products and have become an attractive alternative for banks and thrifts that have experienced shrinking margins in credit cards, mortgage lending, and other consumer product types. Moreover, the shakeout in the subprime specialty finance industry has provided new opportunities for insured depository institutions seeking to enter the subprime lending market. In 1999, several insured depository institutions acquired, or announced plans to acquire, a subprime specialty finance company. Bank and thrift involvement in subprime lending is expected to increase. In fact, some industry analysts predict that insured depository institutions with subprime affiliates will overtake finance companies as leaders in the subprime industry.

Subprime lending poses entirely new challenges in risk management for insured institutions. Not only are expected credit losses higher than for prime consumer lending, but a number of factors suggest that losses are also less predictable:

- **Subprime borrowers are more likely to default than prime borrowers and may be more vulnerable to economic shocks, such as a recession.** Borrowers’ previous credit problems suggest that they have limited financial resources to withstand economic difficulties.

- **Credit-scoring and pricing models used to underwrite subprime loans are untested in a recession.** Analysts have noted that credit-scoring models are less effective in predicting the likelihood of default for subprime borrowers than they are for prime borrowers.

- **Operational risks are greater in subprime lending.** Because defaults occur sooner and more often than in prime lending, subprime portfolios require a greater investment in servicing and collections resources. Subprime lenders run a greater risk that these resources could become severely strained if the level of defaults is not correctly anticipated.

- **Liquidity risks are greater in subprime lending.** Some large-volume subprime lenders heavily depend on the ability to securitize and sell loans to the secondary market. But investor demand for paper backed by subprime loans may be volatile, as was demonstrated during the financial market turmoil of late 1998. A number of nonbank subprime lenders experienced a liquidity crunch as a result of that market turmoil, and several opted for—or were forced into—bankruptcy.

- **Reputation, legal, and compliance risks also are important for subprime lenders.** Subprime lenders generally run a greater risk of violating, or being accused of violating, consumer protection laws or regulations. The public perception of subprime

---

lenders could be tarnished if a recession were to result in substantially higher default rates.

The growing involvement by insured depository institutions in subprime lending has raised significant concerns for bank and thrift supervisors. To address those concerns, FDIC Chairman Donna Tanoue recently announced that the FDIC will propose to the other federal financial institution regulators that insured depository institutions with concentrations in subprime lending be held to higher minimum capital requirements than the current rules dictate. The FDIC proposal includes a common supervisory definition of subprime lending and ties capital adequacy to the types and levels of risks that individual subprime lenders have in their portfolios. This proposal will be shared with other federal regulators to refine a final approach.

Commercial and Industrial Lending

Commercial and Industrial Loan Losses Have Been on the Rise

Insured institutions continue to accommodate the credit needs of business borrowers. Domestic C&I loans grew almost 12.5 percent during the year ending in June 1999 and accounted for 40 percent of all net new loans booked during that period.

Although commercial loan losses are low, there are signs that credit quality in C&I portfolios is deteriorating. Net domestic C&I charge-offs during the first half of 1999 more than doubled from 1998 levels, while noncurrent domestic C&I loans rose by 26 percent. Examiners also have reported increasing problems in commercial portfolios. The Office of the Comptroller of the Currency recently reported that the dollar volume of classified and special-mention Shared National Credits rose 70 percent during a recent annual review.

Slower profit growth and rising corporate bond defaults also point toward somewhat weaker business credit quality. While corporate profits grew by an average of 15 percent per year between 1993 and 1996, economists polled by Blue Chip Economic Indicators project growth of 6.7 percent for all of 1999, followed by growth of only 3.5 percent in 2000. Standard & Poor’s reported that 55 rated issuers defaulted on $20.5 billion in debt during the first six months of 1999. This pace of defaults is already nearly double levels experienced in the first half of 1998 and does not include more recent large defaults such as Iridium and Daewoo Group. Approximately 85 percent of the defaults that occurred during the first half of 1999 were among speculative-grade issuers. According to Moody’s, junk bond defaults rose to 5.8 percent of issues outstanding during the 12 months ending in September 1999, the highest level since 1991.

Rising Losses May Be attributable to Loose Underwriting

Analysts attribute the recent deterioration in commercial credit quality to weak underwriting standards in the corporate debt markets during 1997 and early 1998. Bank underwriting was reported to be particularly accommodating at that time. The Federal Reserve Board reported in its May 1998 Senior Loan Officer Opinion Survey on Bank Lending Practices that domestic banks were “generally eager to make loans to businesses” and that during early 1998 “a large percentage cut their spreads on such loans.” Subsequently, the November 1998 Survey reported a “broad tightening of business lending practices” associated with the financial market turmoil in progress at that time. However, regulators have continued to express concern about the assumptions underlying bank lending decisions. A Supervision and Regulation Letter sent by the Federal Reserve Board of Governors to its examiners in September 1999 noted the recent tightening of standards, but stated that “certain deeper issues remain,” which relate mainly to overoptimistic assumptions about the future repayment capacity of business borrowers.

18 “OCC Says Big Commercial Loans Suffering from Lax Underwriting,” American Banker, October 6, 1999, p. 1. The shared national credit program is a cooperative interagency program to review large credits held at several institutions. Loans subject to review include commitments in excess of $20 million that are shared among three or more participating lenders.
In Focus This Quarter

Leveraged Lending Has Been the Predominant Type of Syndicated Lending

Banks appear to be taking on more risk in the syndicated loan market by expanding their lending to heavily indebted companies. During the first half of 1999, leveraged lending was the fastest-growing segment of syndicated commercial lending. While overall syndicated loan volume was down slightly compared with the first half of 1998, syndicated lending to leveraged companies rose $7 billion, or 5 percent, on the strength of a record volume of “highly leveraged loans.” As shown in Chart 7, loans to leveraged companies are making up a growing proportion of syndicated loan originations.

Factors driving growth in leveraged lending include a high volume of corporate mergers and acquisitions, increasing investor demand for higher-yielding loans, and a shift in preference for loans over bonds by high-yield issuers. While bank syndicators pass a large volume of these loans along to nonbank investors, a substantial portion of these credits remains on bank balance sheets. Loan Pricing Corporation has reported that as much as 64 percent of the value of “highly leveraged” loans originated in the first half of 1999 was retained by banks.

Commercial Real Estate and Construction Lending

Construction Loan Volume Continues to Rise

Loans for real estate construction and development (C&D) represent one of the fastest-growing segments of bank balance sheets, increasing 24 percent during the year ending June 1999. Compared with construction activity in the mid-1990s, spending on new commercial construction has shifted somewhat away from the industrial and retail markets and toward office and hotel construction. Residential construction growth was also strong during the first half of 1999, with single-family completions increasing 17 percent from a year ago. In the midst of this growth in loan volume, loss rates and past-due ratios for construction and development loans remain very low by historical standards, as indicated in Chart 8.

Office Vacancy Rates Are Rising in Many Top Markets

In previously published reports, Division of Insurance analysts identified nine metropolitan real estate markets where rapid development threatened to produce near-term oversupply conditions. These cities were identified based on the pace of current construction activity, commercial space demand indicators, and independent market analysts’ projections. Six of the metropolitan areas identified—Atlanta, Phoenix, Orlando, Portland, Dallas, and Nashville—subsequently experienced large increases in office vacancy rates during the first half of 1999. These areas have also experienced reduced employment growth and slowing net in-migration. Higher vacancy rates are often accompanied by slower

---

23 Syndicated loans are credits extended to large or medium-sized corporate borrowers that are originated by a group, or syndicate, of lenders. One type of syndicated lending is leveraged lending, in which the borrower’s debt-to-equity ratio is significantly higher than the industry average. Loan Pricing Corporation defines “leveraged loans” as those for which pricing exceeds 125 basis points over LIBOR.

24 Loan Pricing Corporation defines “highly leveraged loans” as those for which pricing exceeds 225 basis points over LIBOR.

25 According to Mergerstat, the value of mergers and acquisitions (M&A) was almost $400 billion during second-quarter 1999. According to Loan Pricing Corporation, syndicated loans originated in the second quarter to finance M&A activity totaled some $69 billion—a 43 percent increase over issuance in the first quarter.

rental-rate growth, which may lead to lower real estate values. For example, Atlanta’s vacancy rate rose 1.5 percentage points to 10.3 percent, while growth in rental rates slowed noticeably from the pace of the previous three years.28

* Surveys Suggest Tighter Standards in Commercial Real Estate Lending *

Evaluations of bank loan underwriting suggest a recent tightening of lending standards for commercial real estate loans. The August 1999 Federal Reserve Board Senior Loan Officer Opinion Survey reported a net tightening of commercial real estate underwriting standards, continuing a trend begun in late 1998. The FDIC’s March 1999 Report on Underwriting Practices also found fewer instances of risky lending practices with respect to commercial real estate and construction lending than in prior reports. The FDIC’s September Report showed no significant changes in lending standards.

The FDIC also recently published the findings of a targeted evaluation of the underwriting practices of banks operating in three of the fastest-growing metropolitan areas in the country—Atlanta, Dallas, and Las Vegas.29 Results indicated that competition was generally driving pricing margins down to very low levels, particularly compared with the 1980s. In some instances, lenders have responded to competitive pressures by making structural concessions on loan-to-value, cash equity, and recourse terms, particularly for large borrowers. However, underwriting standards generally have not been as aggressive as practices observed in the 1980s.

* Agricultural Lending *

**Low Commodity Prices Stress the Agriculture Industry**

Low prices for wheat, corn, hogs, cotton, and oilseeds are creating financial difficulties for farmers in the nation’s midsection. Several consecutive years of high worldwide production have resulted in large inventories of grains and oilseeds, which have depressed prices. Prices not only have fallen from mid-1990s levels, but are also low by historical standards. The United States Department of Agriculture (USDA) forecasts for 2000 show little likelihood of improvement in prices.30

The financial outlook for significant portions of the farm sector has deteriorated. The USDA projects that farm income from operations will decline by around 15 percent in 1999 from year-ago levels. However, total net farm income is projected to decline less than 1 percent. A projected $16.6 billion in government payments is expected to make up most of the difference between operating income and total net income.31 Legislation passed in October 1998 provides for $8.7 billion in emergency aid to affected farmers.

**Farm Banks Continue to Perform Well Overall**

Despite the difficulties created by low farm prices, the overall financial condition of the 2,250 FDIC-insured farm banks continues to be strong.32 Farm banks reported an annualized ROA of 1.21 percent and an equity capital-to-assets ratio of 10.5 percent at mid-year.

---

28 Vacancy rates and rental growth rates were obtained from REIS Reports.
31 “Potential Impacts of an Agricultural Aid Package,” Agricultural Outlook, USDA, September 1999.
32 Farm banks are defined by the FDIC as those with over 25 percent of their loans in agricultural production or secured by agricultural real estate.
Loan loss reserves, which stood at 1.58 percent of total loans in June, remain high compared to historical levels. Loan performance at farm banks also appears to be strong at this time. Total past-due loans made up just 2.66 percent of total loans at farm banks in June, a level that is only 9 basis points higher than a year ago. Moreover, this increase in past-due loans is attributable entirely to nonagricultural loans; the level of past-due farm loans has not risen over the past 12 months. At the same time, higher-than-average nonperforming loan levels have been reported by farm banks in the upper Midwest and the South.

There are reasons to believe, however, that it will take time for financial distress among farm producers to significantly affect loan performance at farm banks. One such reason is the increasing use of carryover debt to restructure and extend operating loans that cannot be fully retired by borrowers during the current crop year. The most recent Survey of Agricultural Credit Conditions conducted by the Federal Reserve Bank of Kansas City indicated an increase in the use of agricultural carryover debt by Tenth District banks. An increase in carryover debt was also noted in the FDIC’s March 1999 Report on Underwriting Practices, which indicated that almost one-third of FDIC-supervised farm banks experienced at least a “moderate” increase in agricultural carryover debt during the preceding six-month period. Although the use of carryover debt is not an uncommon practice in agricultural lending, it can be a leading indicator of declining loan performance. Chart 9 shows that increases in carryover debt by Tenth District farm banks in 1995 preceded increased loan losses during 1996.

Funding and Interest Rate Risk

Lagging Deposit Growth Has Led to Greater Reliance on Market-Based Funding

For most of the 1990s, banking industry asset growth has outstripped growth in deposits, creating greater reliance on more expensive and less stable market-based sources of funding. The trend in the loan-to-deposit ratio for commercial banks, which reached a record high of almost 90 percent at June 30, 1999, reflects this shift. Deposit growth has not kept pace with asset growth, in part because of a low rate of personal savings by households and competition for depositor funds from higher-yielding investment alternatives and nonbanks. Lagging deposit growth is particularly important for community banks because these institutions traditionally rely more heavily on deposits to fund assets than do larger banks.

Greater dependence on market-based funding can alter the liquidity and interest rate risk positions of institutions and may require heightened attention to, and expertise regarding, asset-liability policies and procedures.

Growth in Securitization Affects Underwriting and the Structure of Bank Balance Sheets

Banks, and nonbanks in particular, continue to employ the securitization market to fund lending activities.
Issuance of asset-backed securities and commercial mortgage-backed securities (CMBS) totaled $223 billion through the first six months of 1999, and is on pace for another record year. Including participation through credit card companies and CMBS conduit programs, bank-related issuance amounted to about 25 percent of total issuance in 1998, a decline from 1997 levels. Although insured institutions are not dominant players, growth in the securitization market can influence loan underwriting practices and the structure of bank balance sheets.

The securitization market competes to originate loans that could be made by insured institutions. This competition may tend to erode underwriting standards if securitizers ease terms to maintain sufficient volume to support lending pipelines. Recent trends indicate that this competition has intensified. For example, market observers note that the subordination levels in the CMBS market have been declining, which allows securitizers to increase lending volume for a given level of capital.37

When banks do securitize, it is not always clear how much risk is transferred. The issue of credit risk transfer by commonly used securitization structures continues to receive attention from the markets and rating agencies. For example, many analysts agree that revolving structures, such as those used to securitize credit cards, eliminate only the most catastrophic credit risks for issuers.38 In addition, assets created by gain-on-sale accounting rules when loans are securitized can be volatile and can lead to unstable earnings and capital if not properly controlled and administered.

**Banks and Thrifts Appear Increasingly Vulnerable to Rising Interest Rates**

Potentially volatile liabilities and long-term assets have been growing as a percentage of banking assets. Consistent with reduced deposit funding by insured institutions, more market-based and potentially volatile liabilities have been supporting an increasing proportion of banking assets in recent years (see Chart 10).39 At the same time, the lengthening maturity of insured institution mortgage portfolios has increased the percentage of total bank assets with maturities or repricing frequencies of greater than five years. This trend in mortgage portfolios is primarily responsible for the thrift industry’s increasing interest rate sensitivity. According to the **Office of Thrift Supervision’s Quarterly Review of Interest Rate Risk**, interest rate sensitivity for the median thrift rose in the second quarter of 1999 for the third consecutive quarter.

37 Securitizations are often structured in tranches such that a subordinated security bears the credit risk for a senior piece. The relative size of the subordinated piece affects not only funding costs for the issuer, but also the amount of effective leverage achievable through securitization.
38 A common feature of a revolving securitization structure is the provision for an “early amortization.” When a triggering event occurs, such as a negative three-month average spread, all available cash flows are used to pay off bondholder principal. This event causes receivables related to the deteriorating accounts to remain on the balance sheet of the issuer. Unless the deterioration in account credit quality is very rapid and severe, the bondholders will be repaid completely, and the credit risk will be borne by the issuer.
39 Volatile liabilities include borrowings, federal funds purchased, repurchase agreements, jumbo certificates of deposit, foreign deposits, and trading liabilities.

Operational Risks

Insured banks and thrifts face numerous business- and process-oriented operational risks on a daily basis. At the same time, recent industry developments and bank failures have highlighted the importance of maintaining strong operations. The Basle Committee on Banking Supervision reported in late 1998 that “awareness of operational risk among bank boards and senior management is increasing.”

The competitive environment and shareholder expectations have led many insured institutions to search for greater efficiency by cutting costs. In some cases, deep cuts in overhead expenses may weaken the effectiveness of operating and monitoring systems as well as internal controls. Anecdotal evidence from banking regulators suggests that internal control and recordkeeping weaknesses are on the rise. Moreover, industry consolidation and new business activities are creating bigger, more complex, and more decentralized operating environments, especially for the largest institutions. These issues are important since operational weaknesses may leave institutions more vulnerable to adverse economic conditions, insider abuse, or fraud.

Implications

This article has summarized the generally favorable current condition of the U.S. economy and banking industry. The economy is in the ninth year of a remarkable economic expansion that has been conducive to a high level of financial performance on the part of the banking industry. There are, nonetheless, areas of vulnerability that could contribute to a less favorable economic environment and less robust financial performance for insured institutions in the future.

One issue raised by this report is rising indebtedness on the part of households and businesses, which represents a growing private deficit. Rising interest rates could increase the debt service burden for consumers and businesses, making them more vulnerable to a slowing economy. An increasing private deficit is problematic also because the two major sources of financing—foreign capital inflows and domestic credit creation—have the potential to create problems for the economy and for lenders. Dependence on foreign capital makes U.S. inflation and interest rates highly subject to changes in the decisions of foreign investors and the value of the dollar. The rapid pace of credit creation by the financial sector threatens to impair credit quality. The intuition that loose underwriting standards can lead to credit quality problems is supported by recent signs of rising credit losses in a strong economy.

The second issue that cuts across this report is the effect that competition is having on banking strategies and exposures to credit, market, and operational risks. There has been an increase in lending to less creditworthy borrowers, including subprime consumer borrowers and leveraged corporate borrowers. There is also evidence that institutions are pursuing asset-liability structures with higher levels of interest rate risk to maintain loan growth and meet funding needs. Finally, some of the innovations banks have used to counter competitive pressures may introduce new risks associated with complex accounting valuations, weakening internal controls, and the need for more intensive loan servicing.

The third issue is the increasing potential for financial market instability, which leaves the economy and the banking system vulnerable to sudden shocks. Events from fall 1998 showed some of the more damaging aspects of these crises, as market-based financing went from abundance to scarcity virtually overnight. The financial imbalances associated with the rapid creation of credit and borrowing from abroad not only create the need for the economy to slow down eventually, but also threaten to make that adjustment process a volatile one. Financial market shocks could quickly alter the confidence of consumers and businesses and their access to financing. Such instability could end the current expansion and expose underlying weaknesses in bank risk-management practices.

• The San Francisco Region’s job growth rate slowed during the first seven months of 1999 compared with the year-ago period. Nevertheless, jobs were created in the Region at a rate that exceeded the national average.

• The Region’s financial institutions reported healthy conditions; weakness was noted, however, in institutions in Hawaii and Montana. Mortgage and agricultural lenders in the Region reported performance declines, while some smaller commercial lenders increased holdings of traditionally riskier assets.

• Low commodity prices and resulting declines in farm income negatively affected asset quality of the Region’s agricultural banks, particularly in Montana and Washington.

Economic and Banking Conditions

The San Francisco Region’s Economy Continues to Outpace That of the Nation

Despite slowing since 1998, the San Francisco Region’s economy is generally healthy. Total nonfarm job creation continued to exceed the national average, but slowed to an average year-over-year growth rate of 2.9 percent in July 1999 (see Chart 1). Strength in the services and construction sectors offset softness in the manufacturing, aerospace, energy, and agricultural sectors. In particular, rural areas of Montana, Wyoming, Idaho, Utah, Oregon, Washington, and California have been negatively affected by dependence on the agricultural sector during a period of sustained low commodity prices.

As expected within such a large and diverse Region, job growth rates differed greatly during the first seven months of 1999. Five of the Region’s eleven states—Nevada, Arizona, Idaho, California, and Utah—outpaced the nation in job growth during this period because of a strong services sector. Washington and Oregon experienced some weakening in job growth because of reliance on the weaker manufacturing and agriculture sectors. Alaska, Montana, and Wyoming were among the slower growing states in the Region because of lower commodity prices, and Hawaii grew more slowly than the nation because of its depressed tourism sector.

The Services and Construction Sectors Drove Growth in the Region’s Best Performing States—Nevada, Arizona, Idaho, California, and Utah

These states’ job growth rates outperformed the nation’s during the first half of 1999 because of strong growth in the services and construction sectors. Rapid growth in Nevada’s hotel and amusement sector boosted the state’s overall job growth and accounted for nearly 40 percent of the jobs added in the state since January 1999. Specifically, recent openings of 3,000 rooms at the Paris Las Vegas hotel and nearly another 3,000 at the Venetian hotel fueled Nevada’s robust service-sector expan-
Lower Commodity Prices and Weak Eastbound Tourist Volume Hurt Some States in the Region

Alaska, Montana, and Wyoming remained among the Region’s poorest performers at midyear 1999, partially because of low energy and agricultural prices. Alaska’s economy was affected by weak oil prices from late 1996 through year-end 1998, resulting in a 10 percent year-over-year decline in mining employment for the first seven months of 1999. Nearly 7 percent of Wyoming’s total employment is in the mining sector, compared with less than 1 percent for the Region and nation. More than half of these jobs are in the oil and gas industry, making the state’s mining sector vulnerable to weakness caused by low oil prices. Wyoming experienced a 0.9 percent job increase through July 1999, but the mining sector experienced losses of 2.3 percent during the same period.

Montana experienced weakness in the agricultural sector during the first half of 1999. Although the state saw total nonfarm employment growth keep pace with the Region, weakness in the farm sector will likely depress farm employment, given the low commodity prices experienced since 1997. These three states have government sectors much larger than the Region’s average, and these sectors are funded, in part, by the mining industry. Therefore, weakness in the mining industry could affect many more workers than those directly employed in mining.

Hawaii’s economy remained weak during the first half of 1999, affected primarily by the declining number of eastbound tourists. Although the hotel and lodging sector has not added jobs since mid-1997, the increase in the number of westbound visitors to the islands offset some of the negative affects caused by a slowdown in eastbound visitors. However, the Hawaii Visitors and Convention Bureau estimates that eastbound visitors spend significantly more money per day than westbound visitors, indicating that Hawaii may not recover quickly from its economic slowdown.

The San Francisco Region’s Banking Conditions Remain Strong

Despite slowing in the Region’s economic growth, its insured financial institutions reported generally strong earnings as of June 30, 1999. Insured institutions posted 1.33 percent aggregate return on average assets
Regional Perspectives

(ROA) through second-quarter 1999, unchanged from the level reported one year ago. While net interest margins (NIMs) have continued to fall from a year ago, ongoing reductions in overhead and provision expenses have offset these declines. Strong and improving asset quality in most of the Region’s institutions has reduced provision expenses. Reported past-due loans, currently at a low 1.59 percent of total loans for the Region’s insured institutions, remained below the 1.98 percent reported for the nation.

Even though strength in earnings and asset quality was reported for the Region, institutions located in states with weak economies, such as Hawaii and Montana, underperformed peer institutions in the Region and the nation. The performance of Hawaii’s 14 financial institutions, with total assets of almost $30 billion, continued to be hampered by the effects of the turmoil in Asia, which has contributed to the state’s lingering economic weakness and weak real estate markets. In addition, Montana’s 93 financial institutions, with over $11 billion in total assets, reported generally poorer asset quality than the Region and nation primarily because of the great number of institutions concentrated in agricultural lending.

Macroeconomic developments also have negatively affected the financial performance of some institutions concentrating in mortgages. The Region’s 57 mortgage lenders\(^2\) reported declines in NIMs and lower gains on securities and loan sales, likely as a result of the increase in interest rates and a steepening in the yield curve. The changes in the yield curve slowed fixed-rate mortgage origination, reducing mortgage banking revenue and increasing depreciation in available-for-sale securities in many of these institutions, most of which are located in California and Washington.

The Region’s economic strength has contributed to the strong reported asset quality of its commercial lenders,\(^1\) which account for over 31 percent of the Region’s assets. These institutions, however, experienced declining NIMs and lower ROA. As a result, some commercial lenders increased higher-yielding and traditionally higher-risk assets such as commercial real estate, construction, and multifamily residential loans. The growing concentration in higher-yielding assets is particularly notable for commercial lenders with assets less than $1 billion located in Arizona, Nevada, Oregon, and Utah (see Table 1). As a result, these institutions reported higher NIMs and higher ROA figures than the Region and nation did. However, higher concentrations in these potentially higher-risk areas raise concerns, particularly in Oregon and Nevada, where these institutions are reporting increases in past-due loan levels. Hawaii is the only other state in the Region where small commercial lenders reported an upsing in past-due loans.

Finally, stress in the agricultural sector has resulted in lower earnings, falling NIMs, and rising reported past-due loan ratios in the Region’s 93 agricultural banks,\(^4\) primarily located in California, Montana, Washington, and Wyoming. The discussion that follows focuses on deterioration in the Region’s farm sector.

\(^1\) Commercial lenders have commercial real estate, construction, multifamily, and commercial and industrial loans greater than 25 percent of total assets.

\(^2\) Mortgage lenders have single-family mortgage loans and mortgage-backed securities greater than 50 percent of total assets.

\(^3\) Agricultural banks have 25 percent of their loans in agricultural production and real estate loans.

Low Commodity Prices Pressure Some Farmers in the San Francisco Region

Low commodity prices, which have persisted since 1997 for some of the Region’s agricultural products, have adversely affected the Region’s farm sector. Deterioration in the agricultural industry is a concern in the San Francisco Region because of the size of the industry and the number of insured institutions lending to the sector. The Region’s agricultural cash receipts represent over 20 percent of the nation’s total, and California accounts for over half the Region’s total. Although California produces the majority of the Region’s agricultural crops, all 11 states are involved in agricultural production. Consequently, agricultural lending exposure is widespread; over 50 percent of the Region’s 852 insured institutions have extended agricultural loans.

Unlike other areas of the country, in the San Francisco Region the size of agricultural lenders varies significantly, reflecting differences in the size of farm revenues. Average annual cash receipts range from a high of near $311,000 for farms in California to less than $100,000 for farms in Montana, Utah, Oregon, and Wyoming. California is home to three of the nation’s largest agricultural lenders. However, because of large institutions’ product and geographic diversification, these institutions’ relative risk exposure is not as high as that of the Region’s agricultural banks. The Region has numerous smaller institutions with loan portfolios concentrated in the agricultural sector. Although these institutions range in size from $215 million in assets in California to $57 million in Montana, they all are more vulnerable than larger institutions to deterioration in agricultural portfolios because of a lack of product and geographic diversification. (For more information about the San Francisco Region’s agricultural sector and agricultural banks, see the San Francisco Regional Outlook, second quarter 1998.)

Unlike many of the Region’s metropolitan areas that have enjoyed strong economic growth through midyear 1999, many rural areas have experienced economic slowdowns, particularly in the agricultural sector. Declines in agricultural commodity prices appear to be the primary cause for the persisting weakness in the Region’s farm sector since 1997, and, as a result, farm incomes in parts of the Region have declined. In addition, many insured institutions lending to agricultural borrowers have reported rising past-due ratios on agricultural portfolios, indicating that weakness in commodity prices and farm incomes in the Region is beginning to adversely affect agricultural borrowers’ repayment ability.

Commodity Prices and Export Markets Appear Stressed

Among the variety of agricultural products produced in the San Francisco Region, the commodity groups that have recently experienced price declines are wheat, cattle, and vegetables and fruits (primarily apples). Domestic overproduction as a result of improved technology and low incidence of crop diseases is often cited as the primary reason for these declines. Farmers’ response to the Federal Agriculture Improvement and Reform Act of 1996 (FAIR) also led to oversupply problems in the farm sector. When production restrictions were lifted, farmers began planting land that they had previously left fallow. Recent agricultural exports also have declined because of high worldwide production, reduced foreign demand, and a strong U.S. dollar.

Severe price declines in wheat, which ranks among the top ten commodities for eight of the Region’s eleven states (shown in Map 1), concern analysts because of the adverse effects observed in many of the Region’s rural areas where the crop is grown. The price of wheat

---

1 Agricultural lenders are institutions that make agricultural loans. However, these institutions are not necessarily agricultural banks because some do not have 25 percent of loans in agricultural production and real estate loans.
Regional Perspectives

fell from $4.30 per bushel in 1996–1997 to $2.65 for the 1998–1999 marketing year, largely because of strong foreign and domestic production. In 1996, when FAIR was enacted, U.S. wheat supply growth began to outstrip increases in demand, not only because of domestic over-planting but also because of favorable growing conditions and low incidence of wheat diseases. As a result, the beginning stock of wheat began to rise while the price continued to fall (see Chart 2).

In addition, major wheat-exporting countries have large supplies of the commodity, and the U.S. dollar is relatively strong. China, the world’s largest wheat producer, reported record production of the commodity in the 1997–1998 marketing year, with 1996–1997 production and projections for 1998–1999 only slightly lower. Domestic wheat producers’ competitiveness may be further diminished if China devalues the renminbi and the U.S. dollar remains strong.

Cattle, which ranks among the top five cash-producing agricultural products in each of the Region’s states except Alaska and Hawaii (see Map 2), have also been negatively affected by falling prices during the past decade (see Chart 3). Although prices edged up in late 1998 and early 1999, the sector remains weak because of farmers’ decisions to sell animals for slaughter at already low market prices rather than retaining them for breeding. While such action likely will put upward pressure on cattle prices, those farmers who sold heifers at low prices will have to pay higher prices to rebuild their herds.

Apple prices have been under pressure since 1998, as shown in Chart 4. Apples are particularly important to the Washington economy, as well as to the economies of parts of Oregon and California (see Map 3). Specifically, an increase in Chinese apple exports and a decrease in Japanese demand for the commodity have hurt apple prices. In 1998, China brought 2 million more acres of apples into production. At the same time, the Chinese renminbi depreciated against the U.S. dollar, making Chinese apple exports more competitive in the U.S. market. In addition, China’s increased apple production and exports to the U.S. market has negatively affected the price of apple juice concentrate in this country. Juice apple prices fell to $10 per ton in 1998 from $50 per ton

7 The beginning stock is defined as the excess supply of a commodity not sold in a certain marketing year, causing it to carry over into the following year’s supply.

in 1997 and $180 per ton in 1995. In addition, because of Japan’s economic downturn and the fact that apples are considered a luxury there, that country’s demand for apples has declined since 1997.

1998 Farm Incomes Are Weak in California, Montana, and Washington

In 1998, low commodity prices resulted in declining farm incomes, particularly in California, Montana, and Washington. However, in many states, weakness in crop or livestock revenue has been masked by large increases in government payments to farmers, particularly in 1998. In addition, the existence of shared appreciation agreements (SAAs) may increase individual farmers’ debt burdens at a time when farm incomes are weakening.

California’s net farm income experienced the largest decline in the Region during 1998, dropping over 16 percent from peak levels in 1997 to near the state’s 1990 to 1997 average (see Chart 5). The largest declines were evident in cotton, almond, and grape crops, which had particularly strong yields in 1997 but fell to average levels in 1998. Montana’s net farm income increased slightly in 1998 but remained at only 70 percent of the 1990 to 1997 average, primarily because of a decrease in the value of harvested food grains. Washington reported a decline in value of the state’s important fruit and tree nut crop for the second straight year. This sector contributes nearly 20 percent of the state’s total agricultural revenue.

However, high direct government payments and low feed and input costs mitigated weakness in farm income in the San Francisco Region. In 1998, Congress approved a $6 billion aid package to help farmers offset some of the effects of commodity price declines; a larger aid package of $8.7 billion was signed into law in October 1999. Consequently, in 1998 direct government

---

8 Direct government payments are cash payments made directly to farmers and include Production Flexibility Contracts; Loan Deficiency Payments; payments made under the Conservation Reserve, Agricultural Conservation, Emergency Conservation, and the Great Plains Programs; and other miscellaneous payments.

9 In the mid-1980s farm income, farmland values, and the ability of many farmers to service their outstanding debt deteriorated significantly. During this troubled period, the Farm Service Agency (FSA), formerly the Farmer’s Home Administration and the Agricultural Stabilization and Conservation Service, agreed to forgive some of the farmers’ debts. However, after 1988, the FSA required farm program borrowers applying for a debt writedown to sign a shared appreciation agreement (SAA). SAAs allow for the recapture of a portion of farmland appreciation for ten years following the signing of the agreement. The amount of the recaptured debt is limited by the amount of the original writedown.
payments to several of the Region’s states rose substantially, in most cases to record levels (see Chart 6). In addition, grain prices were low, which resulted in reduced feed costs for the livestock sector in 1998.

The existence of SAAs in certain states may result in larger debt burdens in 1999 for some of the Region’s farmers as the first group of SAAs reaches the ten-year recapture date. Table 2 outlines the Region’s SAA exposures. Idaho, which has the Region’s greatest number of farmers holding the instruments, and Montana, which issued the Region’s largest dollar value of agreements, have the greatest exposure to these agreements. Although this exposure is limited, it may negatively affect some farmers, perhaps unexpectedly, by increasing debt levels and hindering their repayment ability.

**Agricultural Banking Conditions**

Analysts’ concern about the Region’s agricultural banks, which hold about $7.5 billion of the Region’s assets, increased in 1999 because of deterioration reported in these institutions’ agricultural loan portfolios. While earnings and capital levels declined slightly through the second quarter of 1999, asset quality at the Region’s 93 agricultural banks has deteriorated noticeably compared with previous years. Insured institutions in Montana experienced the most severe past-due agricultural loan problems in the Region during the first half of 1999. As a result, the total past-due loan ratio for agricultural loans in the state was one of the highest in the Region (see Map 4). Farm banks in Idaho, California, and Washington are also seeing deterioration in asset quality. While government programs guarantee

some of these institutions’ loans, many loans are not guaranteed, leaving lenders at risk of default if commodity prices continue to fall.

As of second quarter 1999, ROA at the Region’s agricultural banks was 1.25 percent, noticeably lower than a year ago, but higher than the national average for agricultural banks. However, the strength in the Region’s ROA may be somewhat distorted because of the existence of 13 Subchapter S agricultural banks in Montana, Wyoming, and California; these institutions tend to have a higher ROA because of their tax-advantaged status. Furthermore, the Region’s Tier One leverage capital ratio of 9.91 percent for the second quarter of 1999 was at its lowest second-quarter level in the past five years.

Despite slightly lower earnings and capital levels, weakened asset quality is the most serious problem facing the Region’s agricultural banks in 1999. This situation may be exacerbated if commodity prices or farm income levels continue to weaken. The Region reported a past-due agricultural loan ratio of 2.78 percent in the second quarter of 1999, which is near the national average for the period. It is the Region’s highest level for that period during the past five years, suggesting that low commodity prices are beginning to negatively affect agricultural borrowers. Montana, Washington, and Wyoming, home to 73 of the Region’s agricultural banks, reported increasing levels of past-due loans (as shown in Chart 7). While Montana is the only state with a past-due loan ratio exceeding the national level, Wyoming and Washington reported increases compared with the past five years. This upswing in the Region’s total past-due agricultural loans is attributed to increases in agricultural production and real estate past-due loans. In addition to declines in asset quality, Montana and Washington have experienced marked deterioration in coverage ratios because provision expenses have not kept pace with large increases in noncurrent loans.

Coverage ratio is defined as the allowance for loan and lease losses divided by noncurrent loans and leases.

CHART 7

Past-Due Agricultural Loans in Montana, Washington, and Wyoming Increase in 1999
Because some of the loans are guaranteed by government programs, it may appear that high past-due loan ratios in the Region’s banks are not a serious concern. However, the level of guaranteed past-due loans in the Region is very small. Chart 8 shows the structure of the Region’s past-due loans, assuming that all past-due guaranteed loans are agricultural loans. Even from this conservative perspective, the volume of past-due agricultural loans remains a concern. Montana appears to be most at risk because, even with the guaranteed portion of the portfolio excluded, the state exceeded the Region’s average as of June 30, 1999.

**Implications for the Region’s Agricultural Banks**

The San Francisco Region has significant exposure to the agricultural sector, given the volume of agricultural products produced in the Region and the number of insured institutions involved in farm lending. The Region’s weakness is concentrated in agricultural banks, particularly those in Montana and Washington. These states have large wheat crops, and Washington is also exposed to the decline in apple prices, which has persisted since 1997. While most states have yet to experience significant declines in net farm income, crop income has fallen. However, this decline has been mitigated by the increase in direct government payments to farmers.

Conditions at the Region’s agricultural banks reflect the stress experienced in the agricultural sector since 1997. While earnings and capital levels weakened slightly in the second quarter of 1999, analysts are primarily concerned about the asset quality deterioration experienced at these institutions. Past-due agricultural loan ratios are high in Montana and have risen in Wyoming and Washington in the second quarter of 1999, compared with 1998 and 1997 levels. This trend suggests that farmers have been negatively affected by low commodity prices and, as a result, could experience repayment problems.
