In Focus This Quarter

◆ Credit Problems for U.S. Businesses Continue to Rise—Commercial loan quality indicators of insured banks have steadily worsened since 1998. Factors contributing to this deterioration include rising financial leverage in the corporate sector as well as weaknesses within certain domestic industries. Many market observers also have attributed the increase in problem commercial loans to a heightened appetite for risk and relaxed underwriting standards from 1996 to 1999. The apparent softening in economic conditions in recent months reduces prospects that business loan quality will improve any time soon. In the meantime, lenders, analysts, and supervisors continue to pay close attention to U.S. business lending conditions. See page 4.

◆ Outlook for Three Industries Facing Uncertainty—Industries as diverse as telecommunications, health care, and textiles have been experiencing problems, despite the economic expansion that began nine years ago. Although the sources of their difficulties are quite different, these industries share some common concerns and challenges. Fierce competition characterizes their operating environment. Armed with a better grasp of the origins of stress in these industries, we will have a better basis for understanding the lending risks associated with a changing policy and economic environment in the years to come. See page 12.

Regional Perspectives

◆ Atlanta—Nearly one-fourth of the counties in the Atlanta Region report employment concentrations in industries that, according to an analysis of economic indicators, could be more vulnerable in the event of an economic downturn. See page 22.

◆ Boston—Commercial loans as a percentage of the total portfolio of the Region’s commercial banks rose steeply in the past three years, suggesting an increased risk profile. See page 23.

◆ Chicago—Slower economic growth and rising exposure to traditionally higher-risk loan types suggest that the credit risk profile of the Region’s insured institutions has increased. See page 24.

◆ Dallas—Increasing oil prices have contributed significantly to the Region’s boom-and-bust periods. However, as the local economies continue to diversify, the benefits of rising oil prices will diminish over time. See page 25.

◆ Kansas City—A review of community banks prior to the 1980s agricultural crisis shows that the relationship between the loan-to-asset ratio and the net interest margin frequently was an indicator of increased potential for failure. See page 26.

◆ Memphis—In an increasingly competitive environment, a slowing economy will challenge the Region’s insured institutions to meet earnings expectations and maintain sound asset quality. See page 27.

◆ New York—As the economy has slowed, the Region’s community banks have reported a shift into traditionally higher-risk, higher-yielding loan categories. See page 28.

◆ San Francisco—Slowing in the Region’s economy could limit consumers’ financial flexibility, contribute to higher personal bankruptcy rates, and adversely affect subprime and specialty credit card lenders. See page 29.
The *Regional Outlook* is published quarterly by the Division of Insurance of the Federal Deposit Insurance Corporation as an information source on banking and economic issues for insured financial institutions and financial institution regulators. It is produced for the following eight geographic regions:

- **Atlanta Region** (AL, FL, GA, NC, SC, VA, WV)
- **Boston Region** (CT, MA, ME, NH, RI, VT)
- **Chicago Region** (IL, IN, MI, OH, WI)
- **Dallas Region** (CO, NM, OK, TX)
- **Kansas City Region** (IA, KS, MN, MO, ND, NE, SD)
- **Memphis Region** (AR, KY, LA, MS, TN)
- **New York Region** (DC, DE, MD, NJ, NY, PA, PR, VI)
- **San Francisco Region** (AK, AS, AZ, CA, FM, GU, HI, ID, MT, NV, OR, UT, WA, WY)

Single copy subscriptions of the *Regional Outlook* can be obtained by sending the subscription form found on the back cover to the FDIC Public Information Center. Contact the Public Information Center for current pricing on bulk orders.

The *Regional Outlook* is available on-line by visiting the FDIC’s website at www.fdic.gov. For more information or to provide comments or suggestions about the National Edition of *Regional Outlook*, please call Lynn Nejezchleb at (202) 898-3898 or send an e-mail to lnejezchleb@fdic.gov.

Letter from the Executive Editor

To the Reader:

The goal of the Regional Outlook is to provide useful risk-related information to bankers, banking agency staff, and other interested readers. To do this more effectively, the second quarter 2001 edition will have a new look. We will publish a single national edition that will provide an overview of economic and banking risks and discussions of these risks as they relate to insured institutions in each FDIC Region. We will tell the national story and, at the same time, alert the reader to specific trends and developments at the regional level.

After considering our experience with this new format, we may adopt it permanently for the second and fourth quarters of each year. The first and third quarter editions will continue to feature in-depth coverage of the economy and banking industry in each Region. Trying new formats will help us find the right balance between regional coverage of specific topics and analysis of economic and banking issues that cut across regional lines.

After you have read the next edition of the Regional Outlook, we would like to hear from you. Does this new approach provide a more effective vehicle for reporting on banking and economic trends? What other suggestions do you have for improving our presentation of risk-related information? Call us with your comments at (877) 275-3342 or (800) 925-4618 (TDD) or e-mail them to lnjezechleb@fdic.gov.

Sincerely,

George E. French
Executive Editor
Credit Problems for U.S. Businesses Continue to Increase

• Commercial credit quality trends have been slipping since 1998, despite generally favorable U.S. business conditions.

• The recent economic slowdown, coupled with tighter credit conditions, points to continued deterioration in business credit quality over the coming months.

• Trends in bond defaults, syndicated lending, corporate profitability, and expected default levels reveal a number of industry sectors that pose a heightened degree of risk to lenders.

Introduction

Continuing increases in problem commercial loans have focused the spotlight on business lending conditions. On September 30, 2000, commercial banks reported the highest relative level of noncurrent1 commercial loans—at 1.52 percent of total commercial loans—since third quarter 1994. In fact, commercial banks have been reporting steadily higher rates of noncurrent domestic commercial loans since the second quarter of 1999. The first quarter 2000 edition of *Regional Outlook* identified several factors contributing to the decline in business credit quality despite the strong economic indicators then in place. These factors, which are still relevant today, include the rise in financial leverage for domestic corporations, greater investment risk appetite and looser underwriting standards from 1996 to 1999, and increasing financial stress within various industry sectors. More recently, an apparent slowdown in economic growth increases prospects for further deterioration in business credit conditions.

Large Banks Experience a Reversal in Commercial Credit Quality Trends

Through much of the 1990s, a sustained period of economic growth produced improving commercial loan credit quality indicators for insured commercial banks. This trend reversed itself in 1998, when banks began experiencing a steady rise in nonperforming and delinquent commercial loans. While the initial catalyst for this reversal was related mainly to events abroad,2 a slowing domestic economy has since taken center stage as the underlying driving force behind worsening commercial credit quality trends.

As of September 30, 2000, noncurrent commercial and industrial (C&I) loans held by commercial banks stood at $15.6 billion, a 46 percent increase over the previous year. Roughly 97 percent of this increase is attributable to the rise in nonaccrual and delinquent credit to U.S. domiciled borrowers. Net C&I loan loss rates are also rising. Through the first three quarters of 2000, annualized C&I loan loss rates reached 0.64 percent, up from 0.58 percent in 1999. The last time banks saw C&I loss rates this high was in 1993 (0.74 percent).

Larger banks, which have the greatest exposures to large- and middle-market corporate credits, have been hardest hit by the turnaround in business credit conditions. As shown in Chart 1, banks with over $1 billion in assets have experienced most of the recent deterioration in C&I noncurrent loan rates. Since the fourth quarter of 1997, the noncurrent C&I loan rate of large

---

1 Nonaccrual loans plus loans 90 days or more delinquent.

2 Significant events that contributed to higher levels of problem foreign loans in 1998 include the collapse of Asian currency exchange rates and default by the Russian government on its sovereign debts. Some domestic industries that were highly dependent on exports (steel, for example) were also adversely affected by these events.
In Focus This Quarter

Business Loan Performance Is Not Likely to Improve Any Time Soon

Prospects for any near-term reversal in deteriorating commercial loan trends are dimming as signs of slower economic growth and tighter credit conditions emerge. Economic indicators suggest an aging economic expansion that is losing momentum. In third quarter 2000, the U.S. economy recorded its 39th consecutive quarter of growth. However, real gross domestic product growth for the third quarter was only 2.2 percent, well below the previous quarter’s growth of 5.6 percent and below the 4.9 percent average quarterly growth rate during the past eight quarters. Corporate earnings also appear to be slowing. Annualized corporate profit growth in the third quarter slowed to 5.1 percent, down from a 15.6 percent annualized growth rate in second quarter 2000 and a 10.4 percent average growth rate over the past eight quarters. Corporate earnings are widely anticipated to slow even further based on the number of companies that have warned of profits falling below expectations in the fourth quarter.

Prospects for slower economic growth prompted the Federal Reserve to lower its target for the federal funds rate (the rate charged on overnight lending) by 1/2 percentage point to 6 percent on January 3, 2000. This cut follows a 175-basis-point increase in the targeted federal funds rate since the end of June 1999. Although higher interest rates have undoubtedly raised borrowing costs for U.S. corporations, business borrowing rates—even before the Federal Reserve cut interest rates in January 2001—are well below those prevalent during much of the 1980s (see Chart 2, next page). Moreover, changes in rates have been far less volatile in the latter part of the 1990s than they were during the 1980s and early 1990s.

Tolerance for risk on the part of investors and lenders is waning. In a November 2000 survey of underwriting practices, the Federal Reserve Board noted that 44 percent of U.S. banks tightened credit terms for large- and middle-market borrowers in the past three months, the highest incidence of tightening since fourth quarter 1990. This tightening of credit terms is primarily in response to economic concerns, industry-specific problems, and a lower tolerance for risk. Banks appear to be especially apprehensive about taking on additional credit risk related to merger and acquisition financing deals, new borrowing prospects, and specific industry segments such as health care, movie theaters, and communications.

Tight credit terms by banks will have the greatest impact on high-risk companies, which have fewer financing options in an environment of slumping bond and stock prices. Moreover, there appears to be a significant increase in the volume of maturing debt that could be forced into default if capital market or bank

---

funding is not available. According to Moody’s, some $108 billion of rated speculative-grade corporate debt held by banks matures over the next three years, a 40 percent increase over year-earlier levels.

Higher-risk companies also have a lower capacity to absorb the cost of higher interest rates. Yet many companies with debt maturing in the near term will likely be forced to pay higher risk premiums than in the past. For example, Moody’s notes that in November 2000, speculative-grade bond yield spreads over seven-year Treasuries reached their widest level since February 1991, at 771 basis points.\(^8\) Chart 3 illustrates further how credit spreads between just-investment-grade bond issues and near-investment-grade bond issues have widened considerably compared with spreads between lower-investment-grade bond issues since the beginning of 2000. Some of the most significant increases in credit spreads have been observed in the high-yield telecommunications sector, where credit spreads over seven-year Treasuries widened by 688 basis points in 2000.\(^9\)

The effects of tighter credit conditions and a reduced appetite for risk are beginning to emerge in loan origination volumes. According to Loan Pricing Corporation, originations of highly leveraged loans\(^10\) through the first three quarters of 2000 fell to $117 billion from $140 billion for the same period in 1999.

Corporate bond trends provide further evidence of financial stress in the domestic market and suggest more near-term deterioration in problem business loans. Corporate bond default rates have climbed significantly since 1997 (see Chart 4). Through November 2000, trailing 12-month default rates on speculative-grade corporate bonds reached 6.8 percent, up from 3.5 percent at the end of 1998. Higher default rates have been accompanied by an accelerated pace of negative ratings revisions, which, according to Moody’s, reached a rate of 3.2 speculative-grade downgrades for every speculative-grade upgrade through the first 11 months of 2000.\(^11\) More signifi-

---

\(^9\) Merrill Lynch Global Bond composites. Issues facing the telecommunications industry are explored further in the article entitled “Three Industries Navigating in a Competitively Charged Environment” in this issue of the Regional Outlook.

\(^10\) Loan Pricing Corporation defines highly leveraged loan transactions as those carrying interest rates of 250 basis points or more over the London Interbank Offer Rate (LIBOR).

Moody’s projects that speculative-grade corporate bond defaults will continue to move higher to 9.1 percent over the coming year. Given a fairly strong correlation between speculative bond default rates and banks’ noncurrent loan rates, these projections suggest a continuing rise in the relative level of problem commercial loans.\(^\text{12}\)

**Loan Default Risk Is Rising in a Number of Industry Sectors**

**Evidence from Corporate Bond Defaults**

Corporate bond defaults provide clues as to which industries may experience a higher rate of defaults. Chart 4 shows the historical trend in speculative-grade bond defaults since 1988. The initial upward spike in default rates in 1998 was largely the result of events abroad, when 74, or 59 percent, of 126 defaulted issues were attributed to foreign-domiciled issues.\(^\text{13}\) In 1999, the distribution of defaults shifted decidedly toward domestic issues, with U.S. firms accounting for 99, or 67 percent, of 147 defaults. Of the U.S.-domiciled defaults in 1999, 64 percent were related to industrial sectors, with concentrations in price-sensitive commodity and trade-dependent sectors such as oil and gas, shipping, and steel. Other domestic sectors that experienced a noteworthy rise in defaulted issues in 1999 were telecommunications and health care. Year-to-date 2000 defaults continue to be dominated by U.S. firms.\(^\text{14}\)

According to Moody’s, year-to-date defaulted bond issues have been concentrated in health care; telecommunications; and textiles, leather, and apparel.\(^\text{15}\)

**Evidence from Syndicated Loan Trends**

Past growth in syndicated loans may be another indicator of default risk. Many lenders appeared to increase their appetite for risk from 1996 through 1999, judging by the growth in leveraged loan and highly leveraged loan volumes during this period (see Chart 5, next page).\(^\text{16}\) Because rapid loan growth can be an indicator of aggressive risk taking, it is important to review some significant borrowing industries that experienced rapid credit growth from 1996 to 2000. It is also worthwhile to review industries where higher-risk (high-yield) borrowing accounted for a substantial proportion of syndicated loan transactions.

\(^{12}\) There is a strong correlation between historical speculative-grade corporate bond defaults and noncurrent loan rates. The correlation coefficient between these two variables for the period 1984 to the present is 0.67.

\(^{14}\) Historical Default Rates of Corporate Bond Issuers, 1999. Moody’s Investor Service.

\(^{15}\) Moody’s Credit Perspectives, December 11, 2000. Issues facing the health care and textile industries are explored further in the article entitled “Three Industries Navigating in a Competitively Charged Environment” in this issue of the Regional Outlook.

\(^{16}\) Loan Pricing Corporation defines leveraged transactions as those that carry interest rate spreads of 150 basis points or more over LIBOR and highly leveraged transactions as those that carry spreads of 250 basis points or more over LIBOR. Because these definitions are spread-driven, the rise in the proportion of higher-yield issuance is attributable in part to a general increase in credit spreads. This was the case particularly during the 1998 period, when credit spreads rose significantly.
Table 1 lists selected industries\footnote{This list is taken from a group of 50 sectors defined using Standard Industrial Codes (SICs). Only industries that accounted for more than 2 percent of 1996 to 2000 origination volumes were considered for inclusion.} that accounted for a significant proportion of syndicated loan volumes from 1996 to 2000, according to Thomson Financial Securities Data. Industries that experienced some of the most rapid growth rates in syndicated loan volumes during that time include utilities, telecommunications, and real estate investment trusts (REITs). Industries that recorded a particularly significant proportion of high-yield transactions during that period include real estate and construction, REITs, health care, and entertainment/lodging/leisure.

### Evidence from Corporate Profit Trends

Industry sector earnings trends may also be an indicator of industry default risk, because higher defaults are more likely in sectors with weak earnings. As noted above, profit growth rates of domestic firms appear to be decelerating following two years of strong earnings growth overall. Rapid growth in previous quarters appears to have been driven in large part by high-tech and related sectors, such as electronic equipment and communications. These sectors have to a large extent overshadowed noteworthy declines in profit growth in other sectors, such as metals, chemical production, medical services, property casualty insurance, apparel and textiles, manufactured housing, agriculture, transportation, and wholesale trade (see Table 2).

### Evidence from Credit Risk Models

Credit default models have proliferated in recent years because of advances in technology, data availability, and financial theory. One such model is KMV LLC's Cred-

In Focus This Quarter

This model, which uses publicly available information to estimate the likelihood of default for individual firms, is widely used by lenders to monitor and evaluate obligor risk and credit risk trends. While it is not the only model available, the KMV model can be applied consistently and easily to the analysis of industry sector credit risk across a broad range of industry groupings.

In brief, the KMV model uses options-pricing theory to derive market-based expected default probabilities or an expected default frequency (EDF<sup>TM</sup>).<sup>18</sup> The model relies mainly on three pieces of information: (1) a firm’s asset market value; (2) the volatility of a firm’s asset market values; and (3) the firm’s capital structure or financial leverage. Although EDF<sup>TM</sup> scores are company-specific, median industry expected default probabilities can be constructed and compared across industries and across time to discern relative rankings of industry risk and industry risk trends. These median EDF<sup>TM</sup> scores also can be mapped to other default measurement scales, such as external rating agency ratings, based on individual EDF<sup>TM</sup> scores of firms with rated debt.

Since the second quarter of 1998, median EDF<sup>TM</sup> scores have risen significantly across a wide range of U.S. non-financial industry sectors (see Chart 6, next page). The service and trade sector includes the greatest proportion of firms with high default risk. The median probability of default for the manufacturing sector firms is lower, but it is rising and roughly equaled that of Standard & Poor’s BB-grade (sub-investment-grade) obligors as of December 2000.

**Sources:** Economy.com Precis Reports; U.S. Department of Commerce, Survey of Business Conditions

<sup>18</sup>Typically expressed as the probability of default over the coming year.
Although no one factor can explain the rise in expected default measures for U.S. nonfinancial firms, rising financial leverage is clearly a major determinant. U.S. corporate debt burdens continue to rise in conjunction with the longest-running economic expansion in U.S. history. The debt-to-net-worth ratio (book value) of nonfarm, nonfinancial businesses rose to 83 percent in the second quarter of 2000, up from 72 percent at yearend 1996. Although these figures remain below the relative debt levels experienced in the late 1980s and early 1990s, U.S. businesses are nevertheless becoming increasingly vulnerable to rising credit costs and disruptions in credit availability. Higher asset value volatility has also played a role in rising EDF scores, which, as in any options-based credit risk model, leads to a greater likelihood of default.

Chart 7 shows eight of the highest-risk industries in terms of changes in median EDF scores over the past two years. These industries were drawn from a list of 50 financial and nonfinancial sectors segregated by Standard Industrial Codes (SICs). For each of these 50 sectors, median EDF scores were determined for December 2000 and compared with median EDF scores for the same sector in December 1998. Consistent with general industry observations, entertainment and leisure, health care, and telecommunication are among the sectors where default risk has risen most significantly over the past two years.

While Chart 7 illustrates sectors undergoing financial stress, it does not provide information on the relative importance of these sectors to lenders. Thomson Financial Securities Data provides information on the volumes of syndicated loan originations by banks and nonbanks. Matching industry-expected default trends with syndicated loan origination trends by industry is one way to determine the relative importance of higher-risk industry credit exposures.

Chart 8 shows median EDF and syndicated loan origination pairs for selected industries during the past three

---

20 Implicit in changes in stock prices.

21 Syndicated loan originations are an imperfect measure of actual loan exposures in the financial industry. For example, it is not possible to determine the level of outstanding exposures simply by summing up origination levels from year to year, because payments on long-term debt are not considered. Moreover, a substantial volume of debt represents revolving lines of credit where credit exposures roll over on a periodic basis. Nevertheless, trends in originations do contain some information on the relative level of industry exposures, because they show which industries are borrowing more or less during any given year.
years. Of the industries shown, the telecommunications industry appears to present the greatest degree of risk, given a nearly $50 billion increase in loan volumes from 1998 to 2000, coupled with a 170 percent increase in median expected default levels over the same period. In contrast, loans to securities brokers and dealers can be considered relatively less risky—despite a $17 billion rise in originations from 1998 to 2000—because of a fairly modest rise in median expected defaults. It is also interesting to contrast the health care and entertainment and leisure sectors. Firms in both sectors have experienced a dramatic rise in expected defaults. However, since 1998, Thomson Financial Securities Data shows a significant curtailment in lending to health care companies, while entertainment and leisure originations have held steady over the same period. Because banks appear to be reducing credit exposures to health care firms, banks should eventually see a decline in the level of defaulting debt related to this sector.

Chart 8 illustrates how U.S. syndicated loan issuance and expected default measures can be linked to produce a better sense of risk-weighted industry exposure volumes held by lenders. On the basis of this type of analysis, producing a list of industry sectors that appear to pose the greatest degree of syndicated loan default risk is relatively straightforward. Perhaps not surprisingly, industries such as telecommunications, wholesale and retail trade, entertainment and leisure, health care, and apparel and textiles rank high in terms of risk-weighted industry credit exposures using this analysis.22

Conclusion

Many U.S. banks are experiencing deterioration in business loan quality measures. The adverse effects of higher interest rates, a tightening of credit terms, slowing profit growth, and industry sector weaknesses are the primary contributing factors to this deterioration. Several indicators—including a projected increase in corporate bond default rates, rising expected default trends in certain industry sectors, and evidence of lax underwriting practices in previous periods—suggest that banks could experience substantial further deterioration in business loan quality in the near term.

Although worsening business loan quality is a concern, these negative trends must be put into perspective. In relative terms, current indicators of business loan problems do not approach the experience of banks during the last economic downturn of the early 1990s. Moreover, continued strong earnings and capital provide a significant buffer for banks to weather the effects of higher levels of nonperforming business loans and business loan losses. Nevertheless, the prospect of a slowdown in the economy raises concerns about the possible severity of commercial loan problems, a situation that will undoubtedly be watched closely by both banks and bank supervisors in the coming months.

Steven Burton, Senior Banking Analyst

---

22 Fifty sectors, grouped by SIC codes, were considered.
Three Industries Navigating in a Competitively Charged Environment

The rising tide of a booming economy in the United States has lifted the boats of a broad spectrum of industries over the past nine years. Some industries, however, have fallen on hard times despite continued economic expansion. These industries represent a broad cross-section of the economy. Problems in these industries were precipitated by diverse factors, reflecting the differences among sectors in industries ranging from old economy (such as textiles) to services (such as health care) to those on the horizon (such as telecommunications).

These industries will navigate in turbulent waters over the next few years. All three face an uncertain economic outlook, changing public policies that can influence their operating environment, and fierce competition. The importance of these industries to the U.S. economy varies based on employment. The telecommunications industry accounts for about 1.4 million jobs, or 0.85 percent of total U.S. employment. ¹ Health care, on the other hand, contributes over 11 million jobs, or 7 percent of total employment. Textile industry employment has been falling steadily for many years and is now under 550,000, accounting for less than 0.40 percent of total U.S. employment.

As diverse as these industries are, a common denominator exists. Intense competition characterizes their operating environment, leaving little room for strategic missteps. Indeed, there have been reports that these industries have been significant contributors to the recent rise in problem bank loans.

With a better grasp of the origins of stress in these industries comes a basis for understanding the lending risks associated with a changing policy and economic environment in the years to come. The following discussion describes trends and developments contributing to stress in these industries and looks at the near- and long-term outlook. Our discussion also looks at the implications for the insured institutions lending to the telecommunications, health care, and textiles industries.

¹ Source: Economy.com. Includes employment in telecommunications services, telecommunications equipment manufacturing, and cable television.

Telecommunications

The telecommunications sector consists of several industry subsectors, including telecommunications services, cable television, and telecommunications equipment, all of which are facing significant challenges.

Telecommunications Services

Rapid growth in the telecommunications services industry has been fueled by strong domestic consumer demand. However, the pace of consumption of telecommunications services has slowed in recent months. This sector has experienced booming growth in revenues from computer network access since 1998, while local and long distance revenues have grown at a much more moderate pace (see Chart 1).

Rapid change and intense competition characterize the industry environment. Long distance businesses, in particular, have experienced fierce competition, resulting in severe pricing pressures. Competitors include both established and new wireline long distance providers, as well as wireless services. Local telephone companies, however, have fared well in recent years, as residences and small businesses have added phone lines to accommodate the growing demand for Internet access. However, as high-speed DSL and cable Internet access become more readily available, the demand for additional telephone lines may diminish, cutting into a lucrative source of revenue for local phone companies.

Capital spending by telecommunications services companies has soared in recent years, although it was expected to level off in 2000 in response to higher interest rates and reduced earnings growth. Nevertheless, high levels of telecommunications equipment investment are expected to continue for the foreseeable future, as telecom service firms require additional equipment upgrades to accommodate increased network traffic and wireless applications (see Chart 2).

Cable TV

Cable TV is another important component of the telecommunications services industry. According to Economy.com, “among the current technologies available, cable is viewed as the leading option for delivering...
video, telephony, entertainment, and computing services to households and businesses.” Cable TV sales revenue has grown more than 19 percent a year since 1995. In spite of this stellar revenue growth, most cable companies are not earning a profit because of the high levels of capital investment required.

Telecommunications Equipment

The telecommunications equipment industry is growing rapidly, as telecom service providers rush to upgrade infrastructure to enhance their offerings of high-speed broadband services. Telecommunications service providers are not only upgrading fiber optic and cable line networks; they are rapidly upgrading antiquated circuit-switched networks to more efficient packet-switch networks. However, the growth in revenues and profits was expected to moderate in 2000 because of higher interest rates and slower growth in the domestic economy (see Chart 3, next page).

The wireless phone industry also has experienced problems since late 2000. The major mobile phone companies have missed earnings projections, casting doubt on the growth potential of the industry. Much is riding on the development of third-generation (3G) wireless technology, which is expected to allow wireless access to the Internet, transmission of video and other images, and videoconferencing—all from a handheld mobile phone. Although huge amounts of money are being invested to develop 3G technology, it is unclear what applications will generate the demand to make the investments profitable.
Outlook

The telecommunications industry has been badly battered in both equity and bond markets in the past several months. A spate of bad news has resulted in sharply lower stock prices and higher costs in debt markets. As a result, the availability of financing for some higher-risk firms is now questionable. Investors are concerned about the prospect of slowing wireless subscriber growth, continuing capital expenditures, intense competition, and the rapid rise in telecom debt\(^1\) (see Chart 4).

The long-term outlook for the telecommunications services industry is positive. The emergence of high-margin technologies and continued growth in wireless subscriber rates should enhance profitability in the future. Consumers and businesses are also expected to spend an increasing share of their incomes on telecom services. Nevertheless, strong competition, huge investments in equipment upgrades, and rapidly changing technology will force firms to be nimble and innovative.

The long-term outlook for the telecommunications equipment industry is positive, as the demand for data, Internet, and wireless services continues to grow strongly. Nevertheless, individual firms in the industry face a highly competitive environment and rapidly changing technology.

Cable TV’s long-term outlook is also positive because of growing advertising sales and technological developments that should allow cable firms to offer a broader array of services. Still, the competitive environment is fierce. In addition to competing with a host of “traditional” telecommunications firms, cable firms must contend with satellite TV providers, which are partnering with major firms to offer sophisticated communications and entertainment services.

Implications for Banks

The most important characteristics of the telecom industry with respect to lending risks are its highly competitive environment and its pace of technological change. These characteristics suggest that the medium-to long-term outlook for a particular credit may not be well represented by current conditions. The success of telecom firms will be based on management’s ability to adapt to change and compete with a fluid set of competitors.

---

With both equity and bond markets turning against the telecommunications industry, cash-hungry telecom firms may have difficulty obtaining financing. This could pose a serious risk for banks with a significant exposure to telecom start-ups without a major partner or an investor sponsor.

The high capital requirements and financial leverage of many telecommunications firms complicate these lending risks. Some of these firms are borrowing heavily to put into place an infrastructure to accommodate a demand for services that is yet to come on-stream, meaning that the payback on this investment may not occur for a number of years.

**Health Care**

Industry trends such as declining hospital occupancy rates and rising outpatient visits to hospitals, intense competition, and the unexpected results of new Medicare policy combined to put the health care industry in difficult financial straits during the past few years. However, subsequent industry consolidation and streamlining and revised Medicare rules have helped to stabilize prospects for many health care providers.

**Recent Trends and Developments**

The health care industry has been suffering since the implementation of the Balanced Budget Act of 1997 (BBA), which cut Medicare payments much more than expected. However, two subsequent bills were passed to “give back” a portion of the Medicare payment cuts implemented in the BBA. The Balanced Budget Refinement Act of 1999 should restore some $16 billion of the cuts to health care facilities over five years. Also, the recently passed Benefits Improvement and Protection Act of 2000 (BIPA) will restore about $35 billion in benefits to the industry over the next five years. BIPA will provide the greatest benefit to hospitals, managed care plans, nursing homes, and home health agencies.

Notwithstanding these favorable developments, other trends continue to pose serious challenges to many firms. Higher labor costs, continued HMO penetration, breakthrough pharmaceutical therapies resulting in reduced demand for services, and increased outpatient volumes have buffeted many health care facilities (see Chart 5 and Chart 6, next page).

**Higher-Risk Sectors**

A better understanding of risks and trends in health care can be gained by discussing its specific sectors. We have segregated these sectors based on the results of an option-pricing model of firm default risk. These models estimate the probability that the market value of a firm’s assets will fall below a level that would trigger default. Firms that have low stock prices, volatile stock prices, or high debt levels will tend to be flagged as having high default risk by such models.

---

Health care industry subsectors have been grouped into three categories: higher risk, moderate risk, and lower risk, which refer to the degree of default risk relative to other subsectors in the industry. The estimated default risk across these subsectors varies substantially. The highest-risk health care sectors include Offices of Medical Doctors; Skilled Nursing Care Facilities; Home Health Care Services; Specialized Outpatient Facilities, NEC; and Health Services (see Chart 7).

**Offices of Medical Doctors** are largely physicians’ practice management firms. These firms acquire a practice of physicians based on a multiple of the practice’s discounted cash flow. The multiple can be several times the practice’s asset value at the time of purchase. However, these firms have had difficulty achieving profitability because of legal restrictions on referrals among affiliated groups of physicians, as well as the reluctance of physicians to submit their medical practice to the criteria of cost control. Total liabilities in this sector have grown rapidly over the past few years.

**Skilled Nursing Care Facilities**’ earnings have been hurt badly by the BBA. However, they stand to benefit from the Medicare “giveback” provided by the recently enacted BIPA, which seeks to rectify the deeper-than-expected cuts in funding resulting from the BBA. Skilled nursing care facilities’ performance has also been adversely affected by (1) declining occupancy

---

1 Credit Monitor’s Expected Default Frequency (EDF) estimates the probability of default within one year. KMV LLC’s proprietary calculation for EDF is based on (1) the current market value of the firm, (2) the structure of the firm’s current obligations, and (3) the vulnerability of the firm to large changes in market value measured in terms of asset volatility. EDFs are one of many potential measures of industry risk, and their use in this article should not be construed as an endorsement by the FDIC or Credit Monitor.

In Focus This Quarter

rates caused at least partly by increased competition from lower-acuity facilities such as assisted living facilities; (2) rising labor and legal costs; and (3) surging debt service costs. Many of these firms are experiencing severe financial stress. The stressed facilities have registered negative net income for the past year or so, as well as burgeoning debt levels. The high debt levels are the result of acquisitions of ancillary support services that in many cases are not generating adequate cash flow because of the BBA. Most of these firms have seen their interest coverage ratios decline sharply over the past few years.

Home Health Care Services focus primarily on respiratory therapy programs and intravenous and infusion services. The industry is undergoing financial stress as a result of the Health Care Financing Administration’s implementation of a prospective payment system that reduced reimbursements on respiratory therapy and infusion therapy.

Specialty Outpatient Facilities, NEC are primarily engaged in outpatient care of a specialized nature, such as alcohol and drug treatment and birth control/family planning. They have permanent facilities and medical staff to provide diagnosis, treatment, or both for patients who are ambulatory and do not require inpatient care. Many of the firms in this sector have experienced a rising debt burden over the past few years, pushing default risk to higher levels.

Health Services firms are engaged primarily in furnishing medical, surgical, and other health services. Firms listed in this broad category rather than more specific categories include companies providing dental services, laser eye correction, and physical and occupational therapy. Many publicly traded firms in this category have experienced sharply rising liabilities over the past three to four years.

Moderate-Risk Sectors

Moderate-risk health care sectors include medical laboratories, hospitals, and HMOs.

Medical Laboratories provide professional analytic or diagnostic services to the medical profession or to the patient as prescribed by a physician. Companies with diverse financial performance and risk of default are included in this sector. A number of medical laborato-

Hospitals, as defined for these purposes, are specialty hospitals. They are primarily engaged in providing diagnostic services, treatment, and other hospital services for specialized categories of patients. Only eight publicly traded firms are listed in this category. They are involved in providing specialized hospital care such as rehabilitation, diabetes treatment, and drug and substance abuse treatment.

Hospital and Medical Service Plans (HMOs) are primarily engaged in providing hospital, medical, and other health services to subscribers or members in accordance with prearranged agreements or service plans. Generally, these service plans provide benefits to subscribers or members in return for specified subscription charges. Also included in this industry are separate HMOs that provide medical insurance. After several years of intense competition among HMOs, which restricted premium-rate hikes when medical costs were rising sharply, HMOs began to pursue a more aggressive approach toward price increases. This new approach has improved the near- and intermediate-term outlook for this sector. Yet, the prospect of the passage of a Patients’ Bill of Rights suggests that rising costs could be an issue for HMOs in the future. As an industry, HMOs are highly concentrated, with the top 10 HMOs accounting for nearly two-thirds of total HMO enrollment in the United States.

Lower-Risk Sectors

The lowest-risk sectors in the health care industry include miscellaneous health and allied services, and general medical and surgical hospitals. Many of these firms have an estimated default risk that puts them in speculative credit risk categories in spite of the fact that they are considered lower risk compared with other health care sectors.

Miscellaneous Health and Allied Services firms are involved in providing kidney or renal dialysis services and outpatient care of a specialized nature, such as alcohol and drug treatment and birth control/family planning. Some firms are engaged in providing health and allied services such as blood banks, blood donor stations, childbirth preparation classes, medical photography and art, and oxygen tent services.

Ibid.

General Medical and Surgical Hospitals provide general medical and surgical diagnostic and treatment services, other hospital services, and continuing nursing services. They have an organized medical staff, inpatient beds, and equipment and facilities to provide complete health care. According to a study conducted by HCIA-Sachs and Ernst & Young, “The BBA created the greatest financial instability that hospitals have experienced since the creation of Medicare in 1965. Yet the most severe reductions have just begun to impact hospitals, and will continue to do so through 2002. The recently enacted Balanced Budget Refinement Act provides little sustained relief to the industry, and significant financial problems are likely to remain.” The study also indicates that smaller hospitals (fewer than 100 beds) are in the “greatest financial jeopardy.” The recent enactment of BIPA will help to stabilize the finances of hospitals over the next several years. However, other trends adversely affecting hospitals include as much as 40 percent estimated excess capacity, rising labor costs, a severe shortage of nurses, continued HMO penetration, breakthrough pharmaceutical therapies, and increased outpatient volumes (see Charts 5, 6, and 8).

Outlook

The outlook for the health care industry has improved substantially in the past year. Industry consolidation and legislation to give back some of the Medicare cuts implemented in the Balanced Budget Act of 1997 have gone a long way to stabilize health care providers’ financial prospects, particularly those of hospitals and nursing homes.

The passage of a Patients’ Bill of Rights in 2001 could also strengthen the hand of health care providers relative to HMOs. Such a bill could contain provisions that would weaken the position of managed care organizations to contain costs and negotiate with health service providers.

Longer term, the demographic trends are positive, with the population aging and life expectancy increasing. The result should be a growing demand for health care services in the future. On the negative side, however, the current trends toward greater use of outpatient procedures and drug therapies will dampen the demand for inpatient hospital services.

Implications for Banks

The opportunities for financing health care firms will continue to grow into the future. Recent experience has shown that the financial performance of many health care providers is profoundly influenced by changes in Medicare policy. As Medicare expenditures grow to occupy a greater and greater place in the federal budget, Medicare policy will be scrutinized to an unprecedented degree, magnifying the importance of understanding the policy risk associated with health care lending.

Powerful demographic trends should lead to the growth in demand for many health care services over the next 10 to 20 years. For example, demand for nursing homes and assisted living facilities will increase sharply as baby boomers reach old age. However, regional supply and demand for these services can get out of balance as providers add facilities to meet demand. Monitoring local demand and supply trends is an important part of assessing the credit risks in these loans.

Textiles

The textile industry has been plagued by excess capacity, fierce competition from cheaper imports, and sagging textile prices. The result was a sharp drop in industry profits in 1999 and continued weakness in 2000.

Recent Trends and Developments

The textile industry is a mature industry that by a number of measures has been declining. Intense competition from low-cost imports has taken its toll on domestic
textile businesses. Since 1995, textile imports have increased nearly 50 percent while exports have grown just under 10 percent. A strong dollar should help textile imports continue to outpace exports. As a result of industry consolidation and the movement of many operations offshore, textile employment has continued to fall steadily. Textile employment has dropped from 663,000 in 1995 to an estimated 544,000 in 2000.\footnote{Economy.com. November 2000. Apparel and Textiles, Precis Industry.}

Closely linked to all these trends, labor productivity in the textile industry is low relative to the average for other manufacturing industries because of low output prices and a heavier reliance on labor in the production process.

The Department of Commerce reports that the industry’s profit as a percentage of sales declined from 3.2 percent in 1998 to just 1.3 percent in 1999 (see Chart 9).\footnote{Office of Textiles and Apparel, U.S. Dept. of Commerce. September 6, 2000. \textit{Current Situation in the U.S. Textile, Apparel, and Manmade Fiber Industries}.} Also, drought in the South has had an adverse effect on textile manufacturing firms, as these firms use a large amount of water in bleaching and dyeing fabric.\footnote{Kilman, Scott, and Amy Merrick. July 25, 2000. “Drought in the South Crimps Economy in Region.” \textit{Wall Street Journal}.}

Because of improving global demand and plant closings in the United States, many analysts believe textile prices have now reached a low point. Indeed, data for 2000 show a slight increase and some firming of prices in the first three quarters of the year (see Chart 10, next page). Nevertheless, the profit picture seems to have weakened further in 2000 because of an increase in nonoperating expenses.

Publicly traded firms in the textile industry can be separated into six major categories: knitting mills, textile mill products, broadwoven fabric mills–cotton, broadwoven fabric mills–manmade fiber/silk, carpets/rugs, and miscellaneous fabricated textile products. The default risk characteristics of these sectors vary significantly as measured by the median EDF\textsuperscript{TM}.

\section*{Higher-Risk Sectors}

The higher-risk sectors include knitting mills, Broadwoven Fabric Mills–Cotton, and Textile Mill Products (see Chart 11, next page).

\begin{figure}[h]
\centering
\includegraphics[width=\textwidth]{chart9.png}
\caption{Textile Industry Profits as a Percentage of Sales Fall in 1999}
\end{figure}

\textbf{Knitting Mills} are engaged in knitting, dyeing, and finishing hosiery, stockings, outerwear, underwear, and other products from yarn or knitted fabrics. Two public firms in this industry accounted for 66 percent of the sector’s 1999 sales. Three out of eight firms in this sector reported net losses and six out of eight reported declining sales in 1999. The trends are similar in 2000 based on incomplete available data.

\textbf{Broadwoven Fabric Mills–Cotton} are engaged primarily in weaving fabrics more than 12 inches in width, wholly or chiefly by weight of cotton. One dominant firm accounted for nearly 38 percent of the sales of all publicly traded firms in this sector in 1999. The performance of firms in this sector was mixed in 1999. Six out of nine of these firms recorded negative net income in 1999. Two companies reported a sizable increase in 1999 net income. Incomplete 2000 results suggest that six firms are in the black, leaving just three with negative net income.

\textbf{Textile Mill Products} is a broad category that includes establishments engaged in performing any of the following operations: (1) preparation of fiber and subsequent manufacturing of yarn, thread, braids, twine, and cordage; (2) manufacturing broadwoven fabrics, narrow woven fabrics, knit fabrics, and carpets and rugs from yarn; (3) dyeing and finishing fiber, yarn, fabrics, and knit apparel; (4) coating, waterproofing, or otherwise treating fabrics; (5) the integrated manufacture of knit apparel and other finished articles from yarn; and (6) the manufacture of felt goods, lace goods, nonwoven fabrics, and miscellaneous textiles. Two firms dominate this sector. Together, they accounted for over 60 percent of the sector’s sales in 1999 (considering publicly traded
firms only). Net income for both firms was off sharply in 1999. Still, some companies registered net income gains in 1999, building on several years of growth in net earnings. Although the 2000 data are incomplete, most firms in this sector have reported weak earnings. Indeed, several firms have reported more quarters of negative than positive net income.

**Moderate-Risk Sectors**

The moderate default risk sectors include Miscellaneous Fabricated Textile Products and Broadwoven Fabric Mills–Manmade Fiber/Silk.

**Miscellaneous Fabricated Textile Products** includes businesses primarily involved in manufacturing curtains and draperies, house furnishings, textile bags, and canvas and related products; performing pleating, decorative and novelty stitching, and tucking for the trade; manufacturing automotive trimmings, apparel findings, and related products; Schiffli machine embroideries; and manufacturing fabricated textile products, not elsewhere classified. Net income for three out of the five publicly traded firms in this sector was negative in 1999. Two of those firms have experienced losses for at least two years’ running. Most of these firms reported negative net income through the first two or three quarters of 2000. The three largest firms’ total debt has grown considerably over the past few years. The increase is related primarily to financing acquisitions.

**Broadwoven Fabric Mills–Manmade Fiber/Silk** are engaged in weaving fabrics more than 12 inches in width using primarily silk and manmade fibers, including glass. Net income for each of the six publicly traded firms in this category was down in 1999—in most cases down sharply. Earnings for most of these firms...
appear to have continued to deteriorate in 2000. Interest coverage ratios for several firms were down in 1999 and 2000 because of lower income, higher liabilities in some cases, and higher interest rates.

Lower-Risk Sector
Manufacturers of carpets and rugs represent the only lower-risk sector in the textile industry.

Carpets/Rugs businesses are involved in manufacturing woven, tufted, and other carpets and rugs. This sector, as a group, experienced strong income growth in 1999. Only one out of six publicly traded firms failed to make a profit in 1999, and several firms reported sizable profit increases. Available 2000 data suggest that each of these firms will have generated positive earnings. Two firms dominate the carpet and rug sector, accounting for about 65 percent of 1999 sales for the group. Carpet and rug manufacturing is capital and research intensive, which gives the U.S.-based firms a comparative advantage over overseas companies, which do not have the same level of access to capital markets and an educated workforce.

Outlook
Some positive factors could temper the adversity being experienced by the U.S. textile industry. Low fiber costs and an improved trade situation with Asia should strengthen the textile industry in the future. Labor productivity has been rising slowly, as firms continue to invest in labor-saving computer technology and equipment. The industry is pursuing various strategies to remain competitive, including consolidations and mergers and setting up operations in Mexico. Nevertheless, the current slowdown in the U.S. economy and the increased risk of an actual recession has posed challenges for the textile industry.

Another concern for U.S. producers is trade liberalization and its effect on textile imports. The normalization of trade relations with China and the elimination of import quotas by 2005 according to the World Trade Organization (WTO) Agreement on Textiles and Clothing could lead to even greater imports.

Implications for Banks
Banks lending to textile firms face an array of risks emanating from the economic environment in which these firms operate. These risks include the ebb and flow of demand associated with the business cycle of the U.S. and world economies; the exchange rate of the U.S. dollar, which affects the competitiveness of domestically produced textile products; and the prices of both inputs and textile products. U.S. trade policy will also have a profound impact on the competitive environment in which domestic textile firms operate. Banks need to monitor these developments carefully.

Concentration risk can be a significant issue for some banks. Textile mill employment is highly concentrated geographically. About 72 percent of all textile mill jobs are located in five southeastern states (North Carolina, Georgia, South Carolina, Alabama, and Virginia). Almost 29 percent of these jobs are in North Carolina alone. Another 18 percent are in Georgia. Even within these states, textile employment can be regionally concentrated, introducing concentration risk to banks with significant exposures to local textile firms. This risk is measured in terms of not only the volume of textile loans in the portfolio but also the spillover effects that plant layoffs can have in the community. In an increasingly global market, credit risk in textiles will depend on decisions about production processes and intercompany linkages. For example, capital-intensive domestic producers may be in a better position to compete with offshore firms with greater access to cheap labor resources. Some textile firms may be able to enhance profitability and control risk by entering into partnerships with domestic and overseas organizations.

Stephen Gabriel, Financial Economist

---

14 See “Regional Economy,” Atlanta Regional Outlook, second quarter 1998.
Despite nearly a decade of economic expansion, growth has not been uniform. Some financially stressed industries may be more vulnerable to an economic downturn or increasing global competition. Others may be undergoing a structural transformation that has constrained growth. Evidence of particular industries coming under pressure may be reflected by the fact that default rates on speculative bonds have been increasing. By comparing data from three industry analysis providers—KMV Corporation, Standard & Poor’s (S&P), and Morningstar—we identified seven industries that are important in the Atlanta Region and that appear vulnerable in the event of an economic downturn: health care; wholesale trade; restaurants; apparel, footwear, and textiles; agriculture; construction; and retail.

One approach to quantifying industry risk is the use of the KMV Corporation’s Expected Default Frequency (EDF™) for publicly traded firms. This approach was referred to in the In Focus segment of Regional Outlook, third quarter 1999. KMV Credit Monitor® uses information from a firm’s equity prices and financial statements to derive the EDF™, which is the probability that the firm will default within a one-year period. The primary determinants of a firm’s likelihood of default are asset value, volatility of the asset value, and degree of financial leverage. We then assume that issues facing publicly traded firms also exist for privately held firms in the same industry segment. This approach allows us to use median industry EDFs™ as an indication of an industry’s relative risk in the Atlanta Region. Data from S&P’s Monthly Investment Review (December 2000) and industry stock performance (as of December 12, 2000) from Morningstar also were used to develop comparable industry risk rankings.

The majority of the workforce in nearly one-fourth of all counties in the Atlanta Region is employed in the stressed industries we identified through the use of data supplied by KMV Corporation, Morningstar, and S&P. Rural areas tend to have the highest exposure to these industry concentrations and therefore may be disproportionately affected should an economic downturn occur. Lower managed-care payments, a critical nursing shortage, and federal reimbursement cuts are generating considerable pressure on the health care services industry. Industry vulnerability, however, may be more pronounced in Florida, home to nearly 40 percent of the Region’s medical services employment. Retailers are increasingly concerned that higher energy costs, a changing interest rate environment, weakening consumer confidence, and lower stock returns could curtail consumer spending and narrow profit margins. Certain areas in the Region may be more vulnerable to overbuilding after nearly a decade of economic growth that has stimulated demand for residential and commercial construction activity, particularly in rapidly growing metropolitan areas.

The Atlanta Region’s banking industry could be affected by further stress in the industries identified in this article. Indirectly, layoffs could result from deteriorating conditions in markets served by stressed industries. Layoffs could negatively affect consumers’ ability to meet debt obligations and, ultimately, could affect credit quality. Insured financial institutions also could experience a decline in asset quality if these industries have difficulty meeting financial obligations.
New England experienced slower economic growth during 2000, but the economy remained healthy overall. Total nonfarm employment gains continued to lag the national average, while the Region’s unemployment rate remained well below average. Per capita personal income growth in the Region again outpaced that of the nation, as it has since 1992, while personal bankruptcy filings continued to move lower through the third quarter of 2000. Home sales and construction showed signs of cooling during the past year, but price appreciation in most major metropolitan markets continued to exceed the national pace. The rate of increase in home prices has been accelerating in smaller, more remote metropolitan areas in the Region as well during the past few years.

The condition of Boston Region insured institutions remains stable. Excluding credit card specialists, the aggregate return on assets for the Region was 1.26 percent as of September 30, 2000, an increase of 6 basis points from a year ago. However, net interest margins continued to decline, with the largest institutions leading the trend. Loan growth among the Region’s small and medium-size institutions continued to be robust, particularly in the commercial, commercial real estate, construction and development, and consumer sectors. This loan growth helped maintain low past-due loan ratios.

Loan composition in the Region’s banks reflects a continued shift into traditionally higher-risk loan categories. Commercial loans are typically higher risk than traditional real estate loans, both commercial and residential. As of September 30, 2000, the Region’s institutions, on an aggregate basis, reported the highest ratio of commercial loans to total loans in the past 11 years. Commercial loans as a percentage of the total portfolio at the Region’s commercial banks rose steeply in the past three years. The Region’s savings institutions also are shifting into a higher concentration of commercial loans, although at a slower pace than commercial banks. While concentrations are below the national average, the change reflects an increasing risk profile for the Region’s banks.

The pace of loans migrating to nonperforming status has increased. On an aggregate level, the Region’s insured institutions show favorable and historically low past-due loan levels. While the larger institutions’ aggregate past-due ratios are beginning to increase slightly, primarily because of rising levels of problem commercial loans, overall, past-due ratios are being diluted by robust commercial loan growth. New loan volume is masking the migration of previously booked loans to past-due status. The aggregate ratios continued to fall for the Region’s smaller institutions and remained low compared with the national average. However, migration analysis indicates that the rate at which seasoned commercial loans are becoming past due began increasing in 1998; if new loans were not being booked, the past-due ratios would be increasing.
过渡到较慢的经济增长引发了某些失衡。

芝加哥区域视角

过渡到较慢的经济增长引发了某些失衡。目前尚不清楚，从中期2000年开始的经济增长放缓是否代表了以快速增长为特征的早期2000年的暂时暂停；一个“软着陆”来实现持续而温和的增长；或者某事更严重的现象。在积极的一面，经济活动水平在2001年初保持了较高水平，尽管在某些关键部门出现了增速放缓。此外，较低的利率可能减缓了伴随经济显著增长放缓而来的潜在中断。

对芝加哥地区来说，全国第四季度2000年的汽车销量相对较高，尽管比第一季度降低了11%。因此，库存较高并且2001年初生产被削减。类似地，单户住宅的许可证在地区内相对较高但呈下降趋势。与此同时，地区私营部门的就业增长放缓至约0.6%的年增长率，为1992年早些时候以来最低。

过渡到较慢增长，本身常常导致短期失衡，因为公司在条件变化中需要时间来适应。公司盈利和偿还能力可能降低，而依靠将持续的收入增长和资产增值的家庭可能面临挑战，因为劳动力或金融市场条件软化。历史经验表明在显著较慢经济增长过渡期间就可能出现信贷质量问题，而不仅仅是经济衰退时。

例如，汽车贷款问题贷款在1990年中期前一年出现。相比之下，商业和工业（C&I）贷款的逾期比例在经济增长加速前仅略微上升，但在上一次衰退期前开始迅速上升。尽管大额机构资本水平上升，提供了额外的缓冲层，应该持续关注C&I贷款质量。

地区的大型机构（资产超过10亿美元）报告称，C&I贷款增速在前12个月加速至16%，为五年来最大增长。与此同时，这些机构的不良贷款的准备金覆盖率也在下降。即使大额机构增加了贷款和租赁损失拨备，但其增长速度没有赶上不良贷款余额的增长，后者由不良C&I贷款驱动。

在9月30日，1.23%的地区C&I贷款为非不良状态，比两年前的0.82%高出41个基点。

在一般情况下，资产质量指标对社区银行和储蓄机构（资产在10亿美元以下的机构）显示出有利的状况；不过某些趋势值得注意。在过去五年中，社区机构的商业和C&I贷款暴露上升，贷款与资产比重提高。尽管如此，1.09%的C&I贷款余额为不良或非利得的，与十年前水平相同。然而，资本水平在相同期间有大幅增加，为经济条件衰退风险增加的贷款质量提供了额外的缓冲层。

1 非不良贷款要么至少迟90天未付，要么在非利得状态。

exposure to credit risk is rising. C&I credit quality warrants monitoring in light of the Region's insured institutions’ rising exposure to C&I loans. In addition, historical experience shows that C&I charge-off rates tend to be higher than for many other loan categories. Although the strongest C&I loan growth has occurred among the Region's largest institutions, increased C&I exposure is evident at some community institutions as well.
Oil and gas is an important industry in the Dallas Region. The Region produced more than 715 million barrels of crude oil in 1997, employing 206,000 workers in the oil and gas extraction industry. Rising oil prices played a key role in the Region’s booming economy during the 1970s, and declining oil prices contributed to the recessions of 1982 and 1986.

Oil prices increased threefold from January 1999 to October 2000. Contributing factors to higher U.S. oil prices include low inventories, a booming global economy, reductions in oil exploration budgets, industrywide consolidation, lack of qualified personnel, and outdated delivery systems.

Potential direction of oil prices in the near term. Oil prices are likely to remain high through midyear 2001 because few oil-producing countries are able to increase production substantially. As a result, supplies are unlikely to rise to a level that would push down oil prices. In the interim, prices will be extremely volatile, as oil markets remain vulnerable to disruptions and cold weather.

Vulnerability of the U.S. economy to higher oil prices. Surging energy prices were a contributing factor in three of the past four recessions (1973–75, 1980, 1990–91). However, the U.S. economy is better able to handle an oil price shock today than it was 20 years ago. For example, technology has allowed many industries to become more efficient users of oil.

Effects of higher oil prices on the Dallas Region. The benefits from higher oil prices have diminished somewhat as the oil and gas industry has gradually declined in importance during the past two decades. At the same time, the high-tech, construction, and financial services sectors have grown in importance.

The impact of higher oil prices has not been widespread. Rather, the effects are more specific to consumers of petroleum products. Corporate profitability has eroded in energy-intensive industries such as transportation, textiles, lumber, paper, chemicals, rubber and plastics, and steel. Higher gasoline and heating oil prices have reduced consumers’ real income and displaced demand for other goods and services.

Effects of higher oil prices on energy lending and Dallas Region insured institutions. During the 1980s, the relationship among the oil and gas industry, the Region’s economy, and the fortunes of banks was a more direct one. Today the relationship is not as clear-cut, as the Region’s economies, particularly in Colorado and Texas, are increasingly diversified. Moreover, the degree of economic diversification has varied by area, and, as a result, the effects of rising oil prices will vary by area as well.
The Kansas City Regional Outlook, first quarter 2001, discusses the strong positive correlation between an insured institution’s loan-to-asset (LTA) ratio and net interest margin (NIM). However, some banks in the Kansas City Region diverged from this relationship in 1999, reporting high LTA ratios and low NIMs, or low LTA ratios and high NIMs.

Chart 1 plots the Region’s community banks by reported 1999 LTA ratios and NIMs and segments the middle quintile. In general, this scatterplot shows that higher LTA ratios correspond with higher NIMs and vice versa. However, the chart also shows unexpected relationships: some banks report low LTA ratios but high NIMs, or high LTA ratios but low NIMs.

The LTA/NIM relationship is an indicator of increased vulnerability to an economic downturn, particularly for banks with higher LTA ratios. Our analysis ranks each quadrant’s relative risk profile using loan levels and composition, growth, and leverage performance variables that are largely responsible for the variance among the quadrants.

This analysis suggests that the two groups of banks characterized by higher LTA ratios may be somewhat more vulnerable during an economic downturn than banks with low loan levels. Moreover, given similar LTA ratios, banks with higher NIMs are more vulnerable than banks with lower NIMs.

Analysis of insured institutions in the Kansas City Region during the 1980s agricultural crisis supports these results and shows that among banks reporting higher LTA ratios, those with high NIMs experienced a significantly higher potential for failure than those with lower NIMs. In the case of banks reporting lower LTA ratios, the NIM level did not result in material differences in failure rates.

Although not predictive of community bank failure rates, the results of our analysis suggest that banks reporting high LTA ratios and high NIMs appear to have a higher risk profile than banks reporting low LTA ratios and low NIMs.
Memphis Regional Perspectives

As the economic expansion reaches a historic ten-year anniversary, there are signs of weakening. The nation’s gross domestic product, the sum of all goods and services produced, continued to grow, but at a substantially slower rate than in previous periods. The Memphis Region experienced moderating economic growth consistent with that of the nation in the third quarter of 2000. Sluggish durable goods sales and growing inventories, particularly in the automobile industry, led to some temporary plant closures and layoffs. As a result, the Region’s employment growth trailed the nation’s for the eighth consecutive quarter.

Competitive pressures continue to drive bank credit exposure. Despite the economic slowdown during the third quarter of 2000, banks and thrifts in the Memphis Region reported increasing credit exposure, with insured institutions’ aggregate loan-to-asset (LTA) ratio reaching a historical high in third quarter 2000. Loan growth is concentrated in traditionally higher-risk loan types. Pressured by rising competition, banks and thrifts have appeared willing to accept greater levels of credit risk to improve asset yields and maintain net interest margins (NIMs).

These trends are most evident in the Region’s metropolitan areas. During the past three years, funding costs among the Region’s metropolitan banks have increased at a faster rate than for rural banks. In response, many insured institutions operating in the Region’s metropolitan areas have tapped into relatively strong loan demand to bolster sagging NIMs. Although insured institutions operating in the Region’s metropolitan areas historically have reported LTA ratios well below national levels, recent loan growth has reversed this trend, and regional levels are now higher (see Chart 1).

Within the Region, banks in the Memphis metropolitan area have reported the greatest increase in funding costs. In 1997, Memphis banks reported aggregate funding costs well below the median reported for all metropolitan markets nationally. Since that time, however, relative funding costs have climbed sharply and are now higher than those in 96 percent of metropolitan areas. Economic prosperity in the Memphis area throughout much of the 1990s encouraged the formation of new insured institutions; 12 new banks have opened in Memphis since 1991, with 9 opening during the past three years. The significant number of new insured institutions striving to grow market share is likely a major factor driving the increase in relative funding costs.

Community banks in the Memphis market have responded to rising relative funding costs by focusing on asset yields and accepting higher inherent credit risk. In the past three years, loans have climbed from 60.5 percent of total assets to 67.8 percent. In addition, banks have participated in the robust real estate market by accepting significantly higher concentrations in commercial real estate loans.

Insured institutions in other metropolitan areas in the Region, including Lexington, Louisville, and Nashville, also face high or rising relative funding costs. These banks have generally followed a similar strategy of increasing loan levels or migrating into traditionally higher-risk loan types, although not to the extent of Memphis banks. Nashville banks will likely experience further competitive pressures in the near term, as the city is reporting considerable new bank activity.

How will banks respond to competition in a slowing economy? In an environment of slower economic growth, the effects of intense competition on earnings in certain markets may become more apparent. If loan demand softens with slowing economic conditions, banks in these markets likely will face difficult strategic decisions that could affect asset quality, earnings performance, or market share.

After a record nine years of economic expansion, growth in the Region’s economy slowed as 2000 came to a close. The Region enjoyed strong productivity, high levels of household income, and generally favorable commercial real estate (CRE) conditions during the past few years. However, slower job and income growth suggest that the Region’s economy will slow further in 2001. Job growth declined because of tight labor markets, which have been constrained by limited population growth in some of the Region’s states and slower growth in the manufacturing and financial services sectors. The Region’s housing sector also may be softening, evidenced by declining sales volume in some of the Region’s larger cities.

The Region’s economy may be more vulnerable to certain economic risks than the nation’s, particularly weakness in the capital markets. Wall Street and many ancillary businesses represent a significant portion of the Region’s economy. Furthermore, higher business costs, prevalent in many of the Region’s larger cities, also could make the Region more susceptible to a slowing economy. In addition, geographic areas that are experiencing higher labor and real estate costs or a greater reliance on oil products could be more vulnerable as companies downsize or relocate to contain costs.

The Region’s insured institutions reported slightly lower profitability for the nine months ending September 30, 2000, than a year ago. The Region’s banks have benefited from the nation’s long economic expansion, experiencing strong loan demand and favorable credit quality. However, competition for bank products and services is becoming increasingly aggressive among bank and nonbank providers. Furthermore, because loan demand has outpaced core deposit growth, the Region’s banks have increased their reliance on non-core funding, which has constrained net interest margins (NIMs) and heightened liquidity risk at some institutions. Higher short-term interest rates compared with a year ago contributed to increased funding costs, which further pressured NIMs at all banks.

The Region’s large banks\(^1\) reported a continued weakening of commercial and industrial (C&I) credit quality. Although well below levels reached toward the end of the 1980s business cycle, the median C&I past-due ratio reported by large banks reached the highest level since 1993. Moreover, an increase nationwide in the number of criticized Shared National Credits, higher corporate bond defaults, and an increased proportion of bond rating downgrades to upgrades suggest that large banks’ C&I credit quality may weaken further.

Community banks’ reported strong loan growth and increased concentrations in traditionally higher risk loan categories. Much as banks did during the 1980s, today’s community banks have increased loan portfolios to meet customers’ financing needs. Recent loan growth has been focused on commercial lending,\(^3\) a typically higher-yielding, higher-risk lending segment. While commercial loan growth suggests an elevated credit risk profile, community banks’ margins have not increased consistent with the traditional risk-reward tradeoff. Increased competition and a flat yield curve have pressured community banks’ margins. Furthermore, while favorable credit quality has aided profitability, there are signs that credit quality may be peaking.

Similar to the 1980s experience, new bank formation in the Region increased during the 1990s economic expansion. However, compared with their 1980s peers, the credit risk profile of today’s new banks appears to be increasing. As of September 30, 2000, the percentage of new banks in the Region slightly exceeded the level achieved at the height of the 1980s expansion. While the Region’s percentage of new banks is equivalent to the national average, some of the Region’s metropolitan statistical areas (MSAs) are home to a greater percentage of new banks. Strong economic conditions, high personal income levels, and bank consolidation have contributed to new bank formation. The Region’s current crop of new banks reported a higher concentration of CRE loans than their 1980s peers. Furthermore, some of the Region’s MSAs with a greater percentage of new banks also have exposure to troubled industries, including the manufacturing and high-tech sectors.

\(^1\) Insured institutions with assets greater than $25 billion.
\(^3\) Includes commercial, commercial real estate, and construction and development loans.
Although the San Francisco Region’s employment growth rate exceeded the nation’s during third quarter 2000, lower corporate profits, increased industry layoffs, and higher personal bankruptcy levels in some states suggest the potential for economic slowing. Several of the Region’s leading personal computer companies, including Intel and Apple Computer, issued earnings warnings because of weakness in demand late in 2000. Also, layoffs among the Region’s Internet companies accelerated through year-end. Finally, annualized data for the first nine months of 2000 show higher personal bankruptcy filing rates in some of the Region’s states, compared with the national average.

Weakness in the Region’s economy has not significantly affected the area’s insured institutions, which reported solid performance through third-quarter 2000. The median return on assets increased from 1.08 percent to 1.15 percent, largely because of a widening net interest margin, despite increased funding costs. Insured institutions offset these higher costs by increasing the proportion of assets invested in higher-yielding commercial real estate loans. Also, some signs of asset quality and liquidity deterioration emerged. For example, median delinquency levels for commercial and industrial loans in some states increased, particularly at community banks. Furthermore, loan growth outpaced core deposit formation and increased banks’ reliance on noncore funding sources.

Although the Region’s insured institutions reported relatively strong conditions through third-quarter 2000, further economic softening may weaken credit quality, especially at institutions with large unsecured or subprime consumer loan portfolios. Nearly all institutions in the Region held some consumer loans as of September 30, 2000; however, subprime and specialty credit card lenders managed the majority of the Region’s consumer loan portfolio. These lenders reported relatively strong performance; however, increased bankruptcy filings, high household consumption, and elevated debt burdens may indicate potential for future consumer credit weakness.

Five of the Region’s 11 states reported personal bankruptcy filing rates that exceeded the national average as of third-quarter 2000. Moreover, filing rates in Utah and Oregon continued to rise, contrary to the nationwide decline. Hawaii, which experienced a period of economic softness during the second half of the 1990s, reported the Region’s largest increase in bankruptcy filing rates. The current level and trend of bankruptcy rates are important because of the historical correlation with consumer credit losses. In addition, with the exception of Hawaii, bankruptcy rates increased between 1995 and 1998 in several states despite the strong economic expansion. The moderation in filing rates in 1999 and 2000 in some states may largely be a result of additional household leverage, specifically mortgage refinancing, rather than an actual improvement in consumers’ financial positions.

Household asset appreciation has contributed to higher consumer spending in recent years. Rising stock prices and rapid home price appreciation allowed consumers to spend more than their disposable income. In the second half of the 1990s, stock ownership and the value of equity holdings increased, providing consumers with access to funds through liquidation of these assets. Furthermore, home prices in several of the Region’s metropolitan areas have increased recently, enabling consumers to borrow against the equity in their homes.

Widespread credit availability and a prolonged period of excellent economic conditions likely contributed to increased debt service levels among consumers. Nationwide, debt service payments in second-quarter 2000 were at the highest level since late 1987. These trends could disproportionately affect consumers with annual incomes below $10,000 because of the use of credit card debt. Surveyed consumers in this income bracket nearly tripled credit card balances held between 1989 and 1998.

The Region’s consumer lenders are likely to be challenged by deterioration in the Region’s consumer sector. An economic downturn could result in increased job losses and reduced stock market and home values. Consequently, consumers in the Region may find it more difficult to liquidate or leverage assets to service debts, and bankruptcy rates could rise. Increasing delinquency and charge-off rates spurred by these trends would particularly affect subprime and credit card niche lenders, because these institutions typically experience relatively higher proportions of past-due consumer loans and consumer credit losses, even in a strong economic environment.
